The SKF brand now stands for more than ever before, and means more to you as a valued customer.

While SKF maintains its leadership as the hallmark of quality bearings throughout the world, new dimensions in technical advances, product support and services have evolved SKF into a truly solutions-oriented supplier, creating greater value for customers.

These solutions encompass ways to bring greater productivity to customers, not only with breakthrough application-specific products, but also through leading-edge design simulation tools and consultancy services, plant asset efficiency maintenance programmes, and the industry's most advanced supply management techniques.

The SKF brand still stands for the very best in rolling bearings, but it now stands for much more.

SKF – the knowledge engineering company

About SKF

The SKF Group is one of the leading global supplier of products, solutions and services in the area comprising rolling bearings, seals, mechatronics, services and lubrication systems. The Group's service offer also includes technical support, maintenance services, condition monitoring and training.

The SKF business is organized into three divisions; Industrial, Automotive and Service. Each division serves a global market, focusing on its specific customer segments.

SKF has 120 manufacturing sites distributed all over the world and its own sales companies in 70 countries. SKF is also represented in 140 countries through some 15 000 distributors and dealers. SKF is

always close to its customers for the supply of both products and services.

SKF was founded in 1907 and from the very beginning focused intensively on quality, technical development and marketing. The results of the Group's efforts in the area of research and development have led to a growing number of innovations that has created new standards and new products in the bearing world.

The Group has a global ISO 14001 environmental certification and global health and safety management standard OHSAS 18001 certification. Its operations have been approved for quality certification in accordance with either ISO 9000 or QS 9000.

Mechatronics

Mechatronics is the science of bringing together mechanics and electronics into exciting new solutions. It is a rapidly advancing area that provides dramatic opportunity to solve old problems in a clever and environmentally friend way. SKF has more than 400 engineers dedicated to this area.

By being at the forefront of this technology for many years, SKF has developed unique application knowledge in hardware and software. In combining actuators, bearings, sealing, lubrication, sensors and electronics competences, we have been able to develop a number of standard and customized solutions. SKF offers a wide assortment of mechatronic products:

- Actuation systems
- Linear motion
- Motion control
- Magnetic bearings

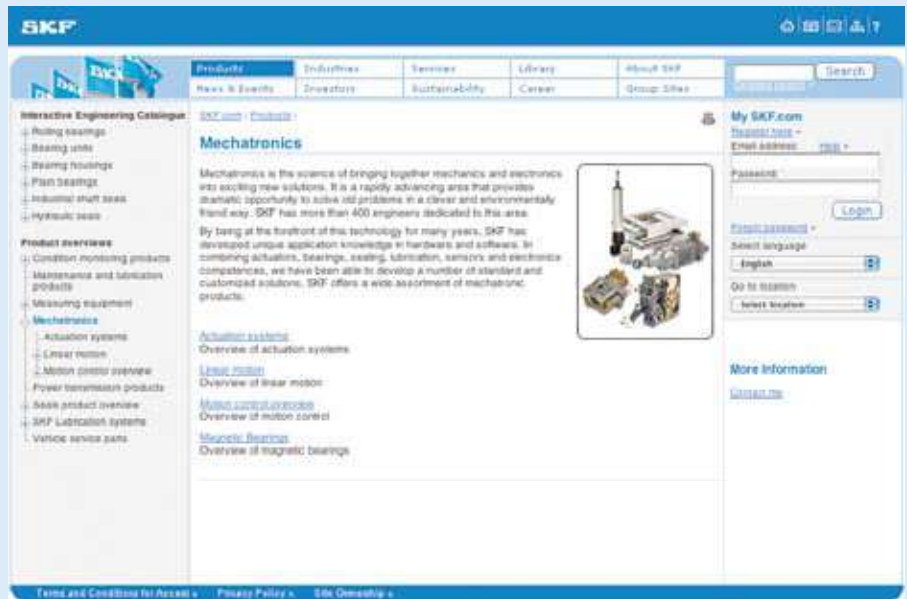

How to get more information

Selecting, defining and purchasing linear guidings, ball and roller screws and actuation systems from SKF has never been so simple.

www.skf.com

Consult SKF's comprehensive website for more information on linear motion and actuation products, together with a description of our services.

On-line product selection

Discover our wide range of high precision components, units and systems for linear movements, providing solutions for guiding, driving, actuation and positioning.

3D drawings download

CAD files of our products can be accessed online following some simple steps: find the right product family from the product tree, you will be sent to the product selector and then find the product designation you want to download.

PDF catalogues download

In addition to this publication we have all product brochures available as pdf documents on the internet, ready to be downloaded.

About this publication

The encyclopedia of the linear motion

This publication introduces over 260 pages of information on all the standard products with clear tables to help the customer select and order the right solution and correct product.

How to handle

This publication consists of 4 chapters divided as follows:

- Guiding systems
- Driving systems
- Actuation systems
- Positioning systems

The chapters are arranged from the most simple, the guiding systems, through to the most complex, the positioning systems, which consists of parts of the other components.

Each linear solution is introduced by a overview, which makes it easy to select the right product.

Different subjects are contained in the separate chapters, starting with a brief general description followed by the specific

ordering key and the drawings with the data tables.

If a subject is divided into several sections, the corresponding ordering key is located at the beginning of each section, followed by the pages with tables and pictures of that section (for example, on **page 19** and on **page 26**, there are two ordering keys for the Linear ball bearings but they belong to different families: compact series and standard series).

The composition of the ordering keys is not unambiguous, due to the structural difference of the products. Instead it follows the type of the individual product.

To determine the product code to be used on the order, do the following:

After identifying the type of product required by examining the relevant pages containing the main data, it is necessary to prepare the code for the order. This may consist of pre-set options, ordering key boxes already filled in (for example: type, colour, etc.) and options that can be selected from several items, empty boxes (for example: design, bearing, nut type, stroke, length, etc.).

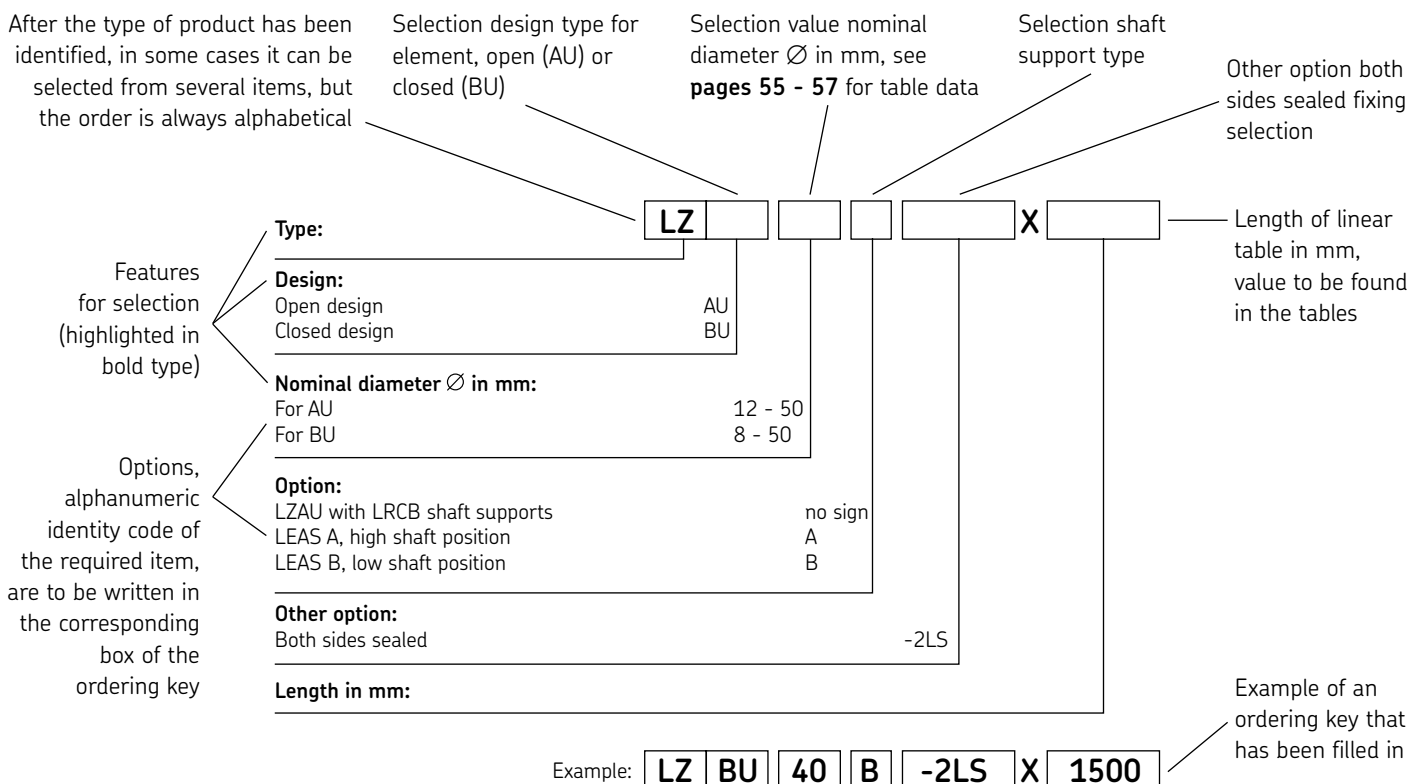

In the ordering key, the options are set out under the associated subjects, with the indication of the code or the information to be entered (with the measurement restrictions contained in the associated table). The sequence of the ordering key is defined by the thin guiding lines that select the corresponding box.

The individual ordering key may contain indications or special notes.

Examples are given at the end of each ordering key.

In the chapter for the actuators, the selection of the item's dynamic load/speed and motor option should be made by use of an additional table with several options located above the ordering key.

An example is given below to show how to prepare the order code for an LZ long linear table.

Light, steady and always on the run

The hummingbird is not only the world's smallest bird, but it is also the most stable, thanks to the incredible speed of its wings (eighty pulsations per second) that allow it to be suspended in flight, so allowing itself to feed on the delicious nectar from many of the flowers in Latin America.

Lightness and stability are among the features that have given SKF the inspiration to create lightweight linear

ball bearings which are capable of accommodating loads with the greatest efficiency.

The potential derived from such lightness is truly impressive.

Guiding systems

Linear ball bearings (fig. 1), profile rail guides (fig. 2), miniature profile rail guides (fig. 3), precision rail guides (fig. 4): limited stroke, very high precision and performance capabilities.

Operating precision (table 1)

Comparison of the different positioning components and systems.

Operating precision (µm)	Guiding systems	Driving systems	Actuation systems	Positioning systems
0,1-1	Precision rail guides	Roller screws		
1-10				
10-100	Linear ball bearings Profile rail guides	Ball screws	Linear motors	Standard drives or linear motors with all guiding systems
100-1 000			Electro-mechanical actuators	

Shaft guidings

Linear ball bearings (fig. 5, 6 and 7) are bushings with recirculating ball tracks which provide low friction movement and the possibility of unlimited stroke. With the range of linear ball bearings, plain bearings and accessories, it is possible to design and build economical and simple linear guidance systems to suit a wide range of applications. The bearings are available in two size ranges: the compact ISO 1 series and the heavy duty standard ISO 3 series (table 2).

N.B.:

SKF linear ball bearings and units for shaft diameter 6 mm and greater are factory prelubricated by default¹⁾.

¹⁾ linear ball bearings without factory pre-lubrication and preservative only can be ordered by using the suffix "/VT808", e.g. LBCR 20 A-2LS/VT808.

Table 2

	Type		Basic dynamic load rating	Stiffness	Speed	Precision
Linear ball bearings						
Compact	LBBR					
Standard	LBCR					
	LBCD					
	LBCT					
	LBCF					
	LBHT					
Linear plain bearings						
Compact	LPBR					
Standard	LPAR					
	LPAT					
Shafts						
	LJM		Standard CF 53			
	LJMH		Hard chromium plated			
	LJMR		Corrosion resistant			
	LJT		Hollow			
	LJMS		Corrosion resistant			

Compact series

LBBR

Compact linear ball bearings available in standard or corrosion resistant versions.

LUHR / LUJR

Linear ball bearing units with either integral seals or G-type seals mounted in the housing.

LTBR

Tandem linear ball bearing units with seals.

LTDR

Duo linear ball bearing units with seals.

LQBR

Quadro linear ball bearing units with seals.

LSHS

Shaft blocks for compact series.

LEBS and LEAS

Tandem shaft blocks suitable for LQBR and LQCD.

2 Guiding systems

Shaft guidings

Standard series

LBCR

Closed linear ball bearings without self-aligning feature.

LBCT

Open linear ball bearings, not self-aligning.

LBHT

Heavy-load linear ball bearings, open type.

N.B.:

All LBC and LBH Linear ball bearings available in corrosion resistant!

LBCD

Self-aligning linear ball bearings, closed type.

LBCF

Self-aligning linear ball bearings, open type.

LUCD / LUCE

Self-aligning linear ball bearing units with adjustable preload.

LUCF

Open self-aligning linear ball bearing units with adjustable preload.

LUCT / BH

Heavy-load linear ball bearing units with adjustable preload.

LUND / LUNE

Self-aligning linear ball bearing units with adjustable preload

LUNF

Self-aligning linear ball bearing units, open type with adjustable preload.

LTCD / LTCF

Open or closed self-aligning tandem linear ball bearing units.

LQCD / LQCF
Open or closed self-aligning quadro linear ball bearing units.

LVCR
Flanged linear ball bearing units.

LSCS
Standard shaft blocks suitable for use with all linear bearing units.

LSNS
Shaft blocks suitable for use with all linear bearing units.

N.B.:
In addition to this catalogue, all product brochures are available on www.skf.com as PDF files.

Publication nr. 4182 EN

Precision shafts

SKF precision shafts (**fig. 8**) can be supplied either as solid or hollow shafts.

The solid shafts are available in all dimensions required to fit SKF linear ball bearings; the hollow shafts have a minimum outside diameter of 16 mm.

They are induction hardened and ground (**see table on next page**). SKF shafts have exceptionally high dimensional stability and long service life.

Yet at the end of shafts of normal production length, deviations of hardness and dimensional stability can occur.

For special applications, solid shafts of stainless steel or hard chromium plated shafts having a chromium layer approximately 10 µm thick can be supplied. When using stainless steel shafts, please note that the surface is not as hard as that of shafts made of high-grade steel. The case depth may also be greater than indicated in **table 5** and this may have an influence on the machinability of the shafts.

Because of the benefits they offer, SKF precision shafts are not only used in combination with SKF linear ball bearings for linear guides, but also for other purposes, for instance axles or column sleeves.

Tolerances

SKF precision steel shafts are available as standard with a diameter machined to tolerance h6 or h7. Other tolerances are available on request. Shafts cut to special lengths have a length tolerance to DIN 7168 "medium". The relevant values are given in **table 4**.

Shafts with radial holes

For linear guides requiring support, shafts with threaded radial holes are needed. These can be supplied by SKF. The radial holes can be positioned either in a way that they accommodate SKF shaft supports or as specified in the customer drawing.

In addition to this catalogue, all product brochures are available on www.skf.com as PDF files.

Publication nr. 4182 EN

2 Guiding systems

Precision shafts

Composite shafts

Composite shafts can be supplied to customer drawings, either with screwed joints or with “plug and socket” joints, depending on the application.

Accurately centred trunnions and sockets guarantee smooth transitions at the butt joint. To ensure correct assembly, the relative positions of the shaft sections and of the shaft ends are marked. Composite shafts should be fastened to a support at the butt joints, particularly when these are of the “plug and socket” type. The radial holes should be positioned as closely to the joint as possible and the shaft length selected in a way that bending of the shaft will not result in a gap forming at the joint.

Materials

SKF precision steel shafts are available as shown in **tables 6** and **7**.

SKF precision shafts are made from the non-alloyed high-grade steels Cf53 (Material No.1.1213), Ck53 (Material No.1.1210), Ck60 (Material No.1.1221) and 100Cr6 (Material No.1.2067).

The surface hardness is between approximately 60 and 64 HRC. The solid shafts of stainless steel are made from the steel X90CrMoV18 (Material No.1.4112) or X46Cr13 (Material No.1.4034). In this case the surface hardness lies between approximately 52 and 56 HRC.

Shafts made from other materials can be supplied to special order.

Table 6

Designation	Type

Linear ball bearing table without drive

LZBU quadro-linear tables (fig. 9)

The closed LZBU quadro linear table consists of a closed quadro linear bearing unit, two tandem shaft blocks and two shafts of the required length.

The bearing unit is fitted with four LBCD-LS self-aligning linear ball bearings, each sealed at one end. The LZBU-“A” design enables axial movement of the linear bearing unit, i.e. the shafts are fixed to the machine bed via LEAS-“A” shaft blocks. The LZBU-“B” design is provided with LEAS-“B” shaft blocks. This combination enables the shafts to travel with the shaft blocks in applications where the linear bearing unit is fixed. LZBU quadro linear tables can be supplied in sizes ranging from 8 to 50 mm. Size 8 tables are not self-aligning and are not designed for relubrication.

The description of the closed quadro-linear table also applies to the combination of series 1 LQBR..2LS quadro linear bearing units with twin LEBS tandem shaft blocks and shafts (on special request only). Shaft diameters range from 12 to 50 mm.

LZAU quadro-linear tables

The open LZAU quadro linear table comprises the open quadro-linear unit and two high precision shafts with shaft

Fig. 9

supports. The bearing unit is fitted with four LBCF-“A-LS” self-aligning linear ball bearings, each sealed on one end. The length of these tables is dictated by the distance between centres of the attachment holes in the LRCB shaft supports. The total length should always be a multiple of this distance. LZAU are available in sizes ranging from 12 to 50 mm.

Applications

In response to industry's ultimate need to produce more with less, SKF has

combined its knowledge and experience with the latest technology to develop solutions for your specific conditions. Whether your goal is to design equipment

that provides more customer value, or to increase overall profitability, with SKF experience and expertise, you're likely to find a real solution.

Profile rail guides

Profile rail guides from SKF are modern machine components used in the production of linear guiding systems with unlimited travel (**fig. 10**).

They usually consist of a profile rail with four precision-ground raceways and a slide unit with four ball circulation paths. This design offers numerous benefits. The square configuration of the raceways results in a guidance system with good rigidity, capable of withstanding moment loads in all directions.

The load-carrying capacity is equal in all four directions (**fig. 11**). Ready-to-mount units guarantee economy and simplicity of mounting. Installation and adjustment procedures are reduced to a minimum. The design of the system is such that inaccuracies of the adjacent components can be accommodated.

SKF profile rail guides are noted for their ease of maintenance and reliability. As standard, they are provided with grease nipple and seals on all sides. The two-point contact of the rolling elements with the raceways permits high operational speeds with quiet running and a low coefficient of friction. Good running accuracy is assured throughout the operational life of the system. Guides with specific preload can be supplied for special requirements. This is achieved through selection. Preload selection depends on the load and stiffness specifications.

Up to 10 µm clearance, play	T0
Preload 0,02×C, light preload	T1
Preload 0,08×C, medium preload	T2*
Preload 0,12×C, high preload	T3*

Rail length in mm

Precision class (for carriage and rail):

Standard precision	P5
Medium precision	P3
High precision	P1*
Super precision	P01*
Ultra precision	P001*

Number of parallel rail tracks:

One rail alone	W1
Two rails in parallel	W2

Accessories & Option symbols:

Jointed rail track	A
Bellows, system complete with bellows	B
Bellow Kit, type 2 (carriage thru the end of the rail)	B2
Bellow Kit, type 4 (between two carriages)	B4
Rail, customized accessories to drawing number	
Rail with cover strip and cover strip guard type 2 (aluminium)	D2
Distance between end face and the first hole (mm):	
Symmetric holes as standard	E = 0
Carriage mounted on rail	M
Scraper plates	S1
Two piece front seals	S2
Seal Kit, two piece front seals with scraper plates	S3

* On request

Example 1: LLR HB 25 - 15 Bellow only with 15 folds Example 2: LLR HC 25 A T1 P5 Carriage only

Example 3: LLR HS 25 - 1000 P5 Rail only Example 4: LLR HS 25 A T0 - 1000 P5 Complete system with carriage and rail

Example 5: LLR HS 25 A [] [] T0 - 1000 P5 W2 / D2 S2 Complete system ind. rail with cover strip and cover strip guard plus two piece front seal

Profile rail guides

Applications

In response to industry's ultimate need to produce more with less, SKF has

combined its knowledge and experience with the latest technology to develop solutions for your specific conditions. Whether your goal is to design equipment

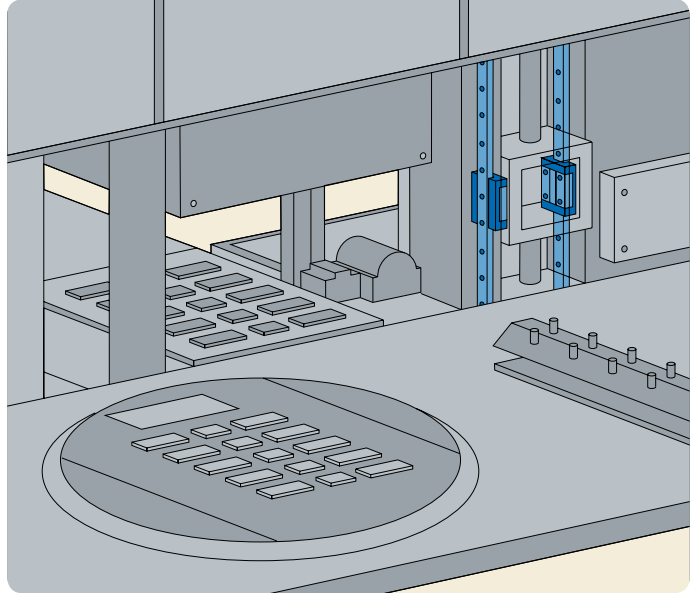

that provides more customer value, or to increase overall profitability, with SKF experience and expertise, you're likely to find a real solution.

Miniature profile rail guides

In response to the market trend for increased performance with a minimum of mounting space, SKF has extended its product range by miniature profile rail guides (fig. 12).

These linear guides are designed above all for applications in precision mechanics, medical engineering, microassembly and the optics industry.

The close cooperation with numerous customers, combined with SKF's experience, has resulted in a range of miniature rail guides that sets new standards, especially when the mounting space is limited, SKF miniature profile rail guides are an excellent choice, as they have a high load-carrying capacity combined with a compact design.

SKF offers its customers an excellent technical advisory service on the spot as well as a vast modular range for the performance increase of machines and installations.

SKF offers these profile rail guides in four sizes (7, 9, 12 and 15 mm) and various slide options to cover most application requirements.

Compact design: thanks to their simple structure, miniature profile rail guides are compact and economical. This small and lightweight product is very suitable for high-speed linear motion up to 3 m/s.

Long-life: gothic arch grooves at the raceway contacts enable the slide to sustain loads and moments from any direction. The raceway shape offers a large load capacity and a long lifetime due to the contact between the raceways and the balls.

Corrosion resistant: all parts of the system are made of stainless steel or plastic material and are thus resistant to corrosion.

Easy to maintain: oil holes in the end caps of the carriage make it easy to relubricate the system.

Structure: four-point contact ball recirculation system with identical load angles and 2 ball recirculation paths per carriage for unlimited stroke.

Range: four different types (7, 9, 12, 15) comprising different widths and carriage configurations (fig. 13).

The preload possibilities for carriage are given in **table 14**, and the technical data in **table 15**.

	T0*	T1*	T2*
TA	×	×	×
LA	×	×	×

* T0 = standard – light preload
 * T1 = medium preload
 * T2 = heavy preload

Rail material:	Stainless steel 1.4034
Carriage material:	Stainless steel 1.4034 with return zones of POM
Ball material:	Stainless steel 1.4034
Sealing material:	Desmopan
Temperature range:	from – 20 °C up to + 80 °C
Speed:	up to 3 m/s max.
Acceleration:	up to 80 m/s ² max.

Preload possibilities for carriage

Technical data

Fig. 14

System accuracy

The system accuracy (**fig. 14**) and the system tolerance (**fig. 15**) of different guidance systems are given in **table 16**.

Fig. 15

System tolerance

Dimension		Class	
		P1	P5
		µm	µm
H*	Dimension tolerance	± 10	± 20
N*	Dimension tolerance	± 15	± 25
ΔH_1^{**}	Maximum tolerance for paired systems or carriages at identical rail position	± 7	± 15
ΔN^{**}	Maximum tolerance for paired systems or carriages at identical rail position	± 7	± 15

* The tolerances apply over the entire guide length for any combination of carriage and rail.
 ** The dimensions ΔH and ΔN relate to the ideal centre of the carriage. Each dimension is derived from the mean value of two measured points with identical centre distance.

System accuracy and tolerance of different guidance systems

The running parallelism accuracy in operation of paired systems are given in **diagram 1** and **fig. 16**.

The positioning (distance) tolerance of rail attachment holes can be seen in **figure 17**.

More precision for more performance

Have you ever wondered how a bird's nest, which appears to be so fragile, can withstand the heaviest rain and strong winds? Birds can weave even the smallest twigs with great precision to form the supporting structure of the nest for the protection of their eggs and new-born chicks from the weather.

This small miracle of nature has given SKF the inspiration to create solutions to satisfy a wide variety of

requests for precision with micrometer accuracy products like precision rail guides, also available with a state-of-the-art anti-creep system. And precision slides are high quality tools for linear motion which are, ideally suited for uses in a wide range of applications where close tolerances are demanded.

SKF products are created to build the future.

Precision rail guides

Modular range rail guides

The modular range consists of a matrix range of rail guide modules which enable an individual choice of combinations of rails and rolling element assemblies. Different requirements for the guides do not call for changes in the design or mechanical environment. Selection of the adequate rail guide is made depending on the mechanical conditions of the application.

These operating requirements are covered by six different models (fig. 18) that may be defined as rail guides with:

- cross roller cages for the standard LWR series
- ball cages for the LWRB series
- cross roller cages for the optimised LWRE series
- cross roller cages with anti cage-creep system (ACSM) for the LWRE series
- needle roller cages for the LWRM/LWRV series and
- slide liners as raceways for the LWRPM/LWRPV series.

Precision rail guides are suitable for applications with limited strokes requiring high stiffness and positioning accuracy.

The modular range series of rails makes it possible to select internal design and/or rolling elements to suit application requirements without changing the envelope dimensions of the rails.

The modular rail range, which is completely interchangeable, is shown in table 17.

This range is suitable for applications with limited strokes requiring high stiffness and positioning accuracy.

Fig. 18

Modular range: interchangeable rail programme	Basic load rating	Speed	Noise	Stiffness	Precision

2 Guiding systems

Precision rail guides

Anti cage-creep system (ACSM)

The ACSM system prevents the cage-creep effect. It is available for any product from the LWRE range.

The non-slip effect is achieved by an involute toothed cogwheel attached to the cage which is inside the LWRE ACSM rails during operation, thus retaining the cage in its defined position. (fig. 19).

This system reliably prevents so-called cage-creep and is mainly used in applications characterised by high rates of acceleration and speeds of travel as well as eccentric loads.

Integration of the ACSM system does not change the mounting dimensions of the LWRE rail guides. This enables LWRE rail guides with ACSM to be used in existing applications without changing the adjacent construction and thus significantly increasing the availability of these machinery elements. Apart from the ACSM system, the former version of ACS is still available. In this version the cogwheel is made of polymer and the stroke length can be specified.

LWRE rail guides with ACS system can be produced in longer sizes.

For further information please consult the SKF catalogue «precision rail guides», publication number 4183 EN.

2 Guiding systems

Precision rail guides

LWR../LWRB..

LWR rail guides are well-proven, limited-travel linear guides used in numerous applications. They consist of two identical rails where cross roller cages or ball cages are inserted, depending on the application and size.

LWR rail guides with cross roller cages are robust linear bearings with high load-carrying capacity. Their special characteristics make them suitable for a large proportion of linear bearing arrangements with limited travel.

LWRB rail guides with ball cage can be used to advantage where loads are light and easy running is required.

They are available for sizes 1 and 2.

Because of the large number of possible combinations, all components of LWR/LWRB rail guides must be ordered separately, for example:

- 4 rails LWR
- 2 cross roller cages LWAL
- 8 end stops LWERA.

LWRE ..

LWRE rail guides are a logical development of the proven LWR rail guides.

Within the modular range system, the LWRE rail guides offer an outstanding price/performance ratio.

Alongside the familiar characteristics of the LWR series, the new LWRE rail guides offer the advantages of a fivefold increase in load-carrying capacity and a doubling of the stiffness, achieved through optimised internal geometry in conjunction with larger roller diameters.

LWRE rail guide can be used in a given design space, maintaining the same load-carrying capacity as the LWR.

The mounting and attachment dimensions of the LWRE 3, 6, 9 rail guides conform to those of all SKF modular range rail guides presented in this catalogue.

LWRE rail guides are optimised with large rollers and improved internal geometry providing high load-carrying capacity and stiffness. They are available with ACSM. As a standard rail guides with ACSM are delivered without end face holes. LWRE rail guides of size 2 are equipped with ball cages.

Because of the large number of possible combinations, all components of LWRE rail guides must be ordered separately, for example:

- 4 rail guides LWRE
- 2 cross roller cages LWAKE
- 8 end stops LWERE

LWRE .. KIT

The KIT package for the modular range is a unique service provided only by SKF.

2 Guiding systems

Precision rail guides

LWRM ../LWRV ..

Guiding systems with high load carrying capacity and maximum stiffness.

Needle roller cages for LWRM/LWRV rail guides

LWHW needle roller cages are made out of aluminium which provide retention of the needle rollers. They are available for size 6 and 9 units.

When ordering, the appropriate cage length in mm must be stated after the cage designation, e. g: LWHW 10 × 225.

End stops for LWRM/LWRV rail guides.

End stops serve to restrict the drift of the needle roller cage from the loaded zone.

LWEARM and LWEARV end stops are fitted with a plastic wiper with a sealing lip serving to reduce the risk of contamination of the raceways.

All end stops are supplied with the necessary attachment screws.

The mounting and attachment dimensions of the LWRM/LWRV rail guides conform to those of the other SKF modular range rail guides included in this catalogue.

Because of the large number of possible combinations, all components of LWRM/LWRV rail guides must be ordered separately, for example:

- 2 rail guides LWRM
- 2 rail guides LWRV
- 2 needle roller assemblies LWHW
- 4 end stops LWEARM.

2 Guiding systems

Precision rail guides

LWM ../LWV ..

These rail guides enable the design of linear guiding systems for heavy loads with maximum stiffness. The internal geometry is identical with that of the modular range rails of the LWRM/LWRV series. As the same needle roller cage is used, the load bearing characteristics are identical. The external dimensions of the LWM/LWV rail guides, however, differ slightly from those of the LWRM/LWRV modular range dimensions.

LWM/LWV rail guides are widely used in machine tools. LWM/LWV rail guides have as standard an attachment hole type 15, i.e. through hole with countersinking.

If attachment hole type 13 is ordered, corresponding threaded inserts are supplied along with the guide.

For new designs, LWRM/LWRV rail guides are recommended. These offer the advantage of being interchangeable with other rail guides of the modular range.

End stops for LWM/LWV rail guides

LWEAM and LWEAV end stops are fitted with a plastic wiper with sealing lip which serves to keep the track free from dirt.

All end pieces are supplied together with attachment screws.

Needle roller cages for LWM/LWV rail guides

LWHW needle roller cages comprise an aluminium cage with needle rollers arranged at right angles to each other. The needle rollers are retained by the cage.

2 Guiding systems

Precision rail guides

LWRPM ../LWRPV ..

LWRPM/LWRPV rail guides are linear guides for limited travel, fitted with Turcite-B¹⁾ slide liners. Based on PTFE, this material is self-lubricating and offers excellent sliding properties.

The slide liners are bonded to the nonhardened LWRPM rail and subsequently ground to size. The LWRPV rail is hardened and ground. In order to avoid damage to the slide surface of the LWRPM rail, the leading edges of the LWRPV rails are slightly rounded. Otherwise, the dimensions of these rails are the same as those of the LWRV series.

LWRPM/LWRPV rail guides should be used where rail guides with rolling element assemblies are unsuitable due to external influences. Such applications

include those subjected to high transverse acceleration that may cause indentation of the rolling elements in the raceways, or where extremely short strokes are required. The unfavourable tribological conditions produced by such operation would give rise to race-way pitting in a rolling element rail guide.

The mounting and attachment dimensions of the LWRPM/LWRPV rail guides conform to those of all the SKF Modular Range rail guides included in this catalogue. LWRPM/LWRPV rail guides are characterised by:

- stick-slip-free operation
- smooth running
- good emergency running properties
- low wear and high reliability
- insensitivity to contamination
- excellent vibration damping properties

When ordering, the individual components of the rail guides must be specified separately, for example:

2 rails LWRPM 6300
2 rails LWRPV 6300

LWRPM rail guides are provided with the slide liners already bonded to the raceways. Due to their design rail guides of these series do not require the use of end stops. Separate ordering of the slide liners and end stops is not required.

¹⁾ Turcite-B[®] is a registered trademark of Busak & Shamban GmbH

Applications

In response to industry's ultimate need to produce more with less, SKF has

combined its knowledge and experience with the latest technology to develop solutions for your specific conditions. Whether your goal is to design equipment

that provides more customer value, or to increase overall profitability, with SKF experience and expertise, you're likely to find a real solution.

Notes

Some things are made to withstand the test of time

The thread of a cobweb is proportionally more resistant than any material ever invented by man – even a steel cable. Here we see just one of the wonders of nature which have inspired SKF to develop products that will last for many years to come.

Screws, guidance systems and many other components bearing the name of SKF are made from stainless steel and are designed to withstand

a corrosive environment, at the same time providing the highest quality of performance with long-term reliability for all your applications.

With SKF, technology lasts.

Driving systems

Ball and roller screw

SKF ball & roller screw assemblies are high-quality products, suitable for a wide range of applications where precision driving systems are needed.

The high efficiency screw allows loads to be displaced by transforming rotary action into linear motion. The high efficiency screw has rolling elements, balls or rollers, between the nut and the screw shaft.

In all types of ball screws (figs. 1, 2 and 3), the load is transmitted from the screw shaft to the nut through each ball: several recirculating systems are available. To improve positioning accuracy, backlash can be reduced or eliminated.

Roller screws (fig. 4) are available in two non-competing designs which cover requirements beyond ball screw limitations.

Load transfer from the nut to the screw shaft through a number of threaded or grooved rollers results in a large number of strong contact points.

Operating precision (table 1)

Comparison of the different positioning components and systems.

Operating precision (μm)	Guiding systems	Driving systems	Actuation systems	Positioning systems
0,1-1	Precision rail guides	Roller screws		
1-10	Linear ball bearings	Ball screws		Standard drives or linear motors with all guiding systems
10-100	Profile rail guides		Electro-mechanical actuators	
100-1 000	Standard slides	Linear motors		

3 Driving systems

Ball and roller screw

How to make your choose

In our wide range of products, you are sure to find the one that exactly fits your requirements:

- The miniature ball screws (**fig. 5**), either with ball recirculation by integrated tube or with inserts, are very compact. Backdriving makes them highly efficient.
- The large ball screws (**fig. 6**) enable you to select the right level of requirements: simple transport screws, very fast screws with long lead, or preloaded screws for more precision.
- Ground ball screws (**fig. 7**) for more rigidity and precision
- Roller screws (**fig. 8**) which are far beyond the limits of any ball screws for heavy loads, ultimate precision and rigidity, high speed and acceleration and use in very difficult environments.

Table 2 will assist you in your selection.

Type	Details	Basic dynamic load rating	Precision Ep (μ) on 300 mm	High duty cycles	Adverse environment (Spec. steel, pollution)
	SD/BD/SH Diameter Ø 6 to 16 mm	 Up to 7,6 kN	 G9 (130 μ) to G5 (23 μ)		 Good
	SX/BX, SN/BN/PN SND/BND/PND SL/BL, SLD/BLD Din standard Ø 16 to 63 mm	 Up to 95 kN	 G9 (130 μ) to G5 (23 μ)		 Satisfactory
	PGFE, PGFJ, PGFM, SGFE Ø 16 to 125 mm	 Up to 680 kN	 G5 (23 μ) to G1 (6 μ)		 Satisfactory
	SRC, SRF, TRK/PRK, SVC, PVK Ø 8 to 210 mm	 Up to 2 235 kN	 G5 (23 μ) to G1 (6 μ)		 Exceptional

Ball screws

Rolled ball screws

SKF ball screw assemblies are high-quality products, suitable for a wide range of applications where precision driving systems are needed.

SKF rolled thread ball screws are available in four designs to cover most requirements.

Complete assemblies

A complete range of accessories is available and can be delivered completely assembled. Just ask when ordering (fig. 9).

Fig. 9

Service range

General rules

Delivery time	Delivery time from a couple of days to max. two weeks is possible for orders meeting the following conditions:
Quantity	<ul style="list-style-type: none"> • Max. 5 pcs. for types SX/BX - SN/BN/PN - SL/BL • Max. 15 pcs. for types SH - SD/BD
Materials	Both shafts and nuts should be made of standard steel (refer to our catalogue 4141). Neither stainless steel nor special treatments are accepted through this quick channel.
Capabilities	<ul style="list-style-type: none"> • Standard nuts, including DIN nuts • Screw shafts as per customer drawing (splines & special treatments excepted) • Preload by oversized balls accepted for BX - BN/BND - BL/BLD. Preload not accepted for screws with diameters equal to or less than 16 mm (BH- BD - BN - BND) • Rotating nut, SLT/BLT is excluded

Diameters	Leads	Nut types	Precision classes	Accessories
From 6 to 63 mm	From 2 to 50 mm	Cylindrical and flanged with axial play, backlash elimination and/or nuts preload, SKF & DIN standards	G5 - G7 - G9	For screw shafts and nuts

N.B.:

In addition to this catalogue, all product brochures are available on www.skf.com as PDF files.

Publication nr. 4141 EN

Notes

A large grid of graph paper for taking notes, consisting of 20 columns and 30 rows of small squares.

3 Driving systems

Ball screws

Rotating nut

The nut rotates inside bearings and moves along the fixed long lead screw shaft. The drive motor moves with the nut, so inertia and critical speed problems, associated with a long rotating shaft, are minimised (**figs. 10** and **11**).

Two versions available:

SLT: rotating nut using ball screw with axial play

BLT: rotating nut using ball screw with backlash elimination.

Size	Ball screw capacities		Bearing axial capacities	
	dynamic C_a	static C_{0a}	dynamic C_a	static C_{0a}
kN				
25 × 20	39,5	96,6	61,8	56
25 × 25	33,5	80,5	61,8	56
32 × 20	49,8	141,2	78	76,5
32 × 32	32,1	87,3	78	76,5
32 × 40	30	81,7	78	76,5
40 × 20	54,7	176,7	93,6	91,5
40 × 40	53,3	133,8	114	118
50 × 50	94,8	238,2	156	166

Rotating nut inertia

Size	Inertia Pulley support	Mass of rotating nut
	kgmm ²	kg
25 × 20	1 012	4,5
25 × 25	1 023	4,6

Ball screws

Shaft end combinations for rolled ball screws

In the order code, shaft end machining is defined by:

- one letter for $\varnothing < 16$ mm
- two letters for $\varnothing \geq 16$ mm

resulting from the combination of two machined ends (see designation **page 108**).

Machined ends are represented in detail on **page 119** for $\varnothing < 16$ mm and **pages 120–121** for $\varnothing \geq 16$ mm

$\varnothing < 16$ mm		$\varnothing \geq 16$ mm

3 Driving systems

Ball screws

Standard end machining for nominal diameter ≥ 16 mm

Standard shaft ends for ball screws, nominal diameter ≥ 16 mm, have been developed to suit the SKF thrust bearings FLBU, PLBU and BUF.

These standard ends are the same for all screw types.

However, for the "SL/TL" long lead screw, an additional shoulder, part of the threaded length, will be machined to protect the wiper and nut thread during assembly (both

sides) Apart from this, the end itself is the same for all screw types.

End bearing \Rightarrow Machined end type

FLBU	2A or 3A
PLBU	2A or 3A
BUF	4A or 5A

For SD/BD, SX/BX, SN/BN/PN, SND/BND/PND

Ball screws

Ground ball screws

SKF offers a wide range of ground ball screws (figs. 12 and 13) to cover all requirements

- Flanged nut with internal preload, DIN standard
- Double preloaded flanged nut, DIN standard
- Double cylindrical preloaded nut
- Single nut with axial play DIN standard
- Single nut preloaded end flange
- Double nut preloaded end flange
- Double nut preloaded center flange
- Single nut preloaded cam shaped

Service range (Europe only)

General rules

Delivery time	<ul style="list-style-type: none"> • one / two weeks without machined ends • three week with ends machined to customer drawings.
Quantity	Max. 3 pieces for standard PGFJ, PGFE, SGFE, DIN standard.
Precision classes	G3 - G5 - G7
Materials	<ul style="list-style-type: none"> • Standard steel only for the shafts • C53 for the screws • 18NiCrMo5 for the nuts (refer to our catalogue 4621).
Capabilities	<ul style="list-style-type: none"> • Screw shafts, right hand, single start, as per customer drawing (splines and hollow shafts excepted). • Neither stainless steel nor special treatments are accepted through this quick channel. • Maximum length : 1 800 mm except for 25×5 which is limited to 1 000 mm
Sizes	<ul style="list-style-type: none"> • 25×5 • 32×5 • 40×5 • 40×10 • 50×5 • 50×10 • 50×20 (except for PGFJ) • 63×10

Standard range (all countries)

Diameters	Leads	Nut types	Precision classes
From 12,7 to 152 mm	From 2,5 to 40 mm	Cylindrical or flanged nuts with preload or axial play	G1 - G3 - G5
From 0,5 to 6 inches	From 0,1 to 1,6 inches	Cylindrical or flanged nuts with preload or axial play	G1 - G3 - G5

3 Driving systems

Ball screws

Applications

In response to industry's ultimate need to produce more with less, SKF has

combined its knowledge and experience with the latest technology to develop solutions for your specific conditions. Whether your goal is to design equipment

that provides more customer value, or to increase overall profitability, with SKF experience and expertise, you're likely to find a real solution.

Machine tool

Pick and place robot for laboratory

Components application
a) Precision ball screws

Roller screws

There are two non-competing designs to cover requirements beyond ball screw limitations. Load transfer from the nut to the screw shaft through a number of threaded or grooved rollers: the resulting large number of contact points ensures a much higher load carrying capacity and a much longer life than ball screws of similar size.

“SR” Planetary roller screws (fig. 15)

Non-recirculating rollers yield high speed and acceleration capabilities, exceptional reliability and resistance to adverse environments.

“SV” Recirculating roller screws (fig. 16)

Very fine lead of thread (1 mm) allows high positioning accuracy, repeatability and exceptional rigidity.

Fig. 15

Fig. 16

SR planetary roller screw

SV recirculating roller screw

Ten reasons for using roller screws

- High load ratings (SR-SV)
- Very high rotational speed (SR)
- High acceleration and deceleration rates (SR)
- Long life at high cycle rates (SR)
- High reliability (SR-SV)
- Resistance to hostile surroundings (SR)
- Ability to accommodate shock loads (SR)
- Small displacements with very good repeatability (SV)
- Nut rotation when speed becomes critical (SR)
- Frequent removal of the nut from the screw shaft (SR, most SV)

Type	Features
SR SV	Higher static load up to 12 000 kN
SR SV	Higher dynamic load up to 2 235 kN
SR	Higher rotational speed - Ø 48 at over 3 000 rpm
SR	Higher acceleration over 12 000 rad/sec ²
SR	Shock loads
SR	Adverse environments (dust, ice, sand)
SV	1 mm lead
SR SV	Stainless steel

N.B.:

In addition to this catalogue, all product brochures are available on www.skf.com as PDF files.

Publication nr. 4351 EN

3 Driving systems

Roller screws

Planetary roller screws

(fig. 17)

Features

- Many strong contact surfaces
- Non-recirculating rollers
- No weak point in the nut

Benefits

- Long life: high load carrying capacity
- Robust and shock resistant
- Exceptional reliability
- High speed & acceleration capabilities

Fig. 17

Threaded rollers are the basis of SR/BR/TR/PR planetary roller screws (fig. 18).

Fig. 18

Typical applications

The capacity to carry heavy loads for thousands of hours in the most arduous conditions makes planetary roller screws suitable for the most demanding applications. The robust nut can withstand shock loads and the timing mechanism ensures reliability even in harsh environments and at high accelerations; the long lead and the symmetrical design of the nut permit high linear speeds.

Examples:

- Machine tools
- Injection moulding
- Factory automation process including spot welding, broaching, clamping, presses, guns, etc...
- Test benches
- Steel industry
- Tyre industry
- Automatic handling
- Military aircraft, tanks, rocket launchers, radar, ships and submarines
- Nuclear industry
- Transportation industry

Recirculating roller screws (fig. 19)

Features

- Many strong contact points
- Very small leads (1 mm)
- No miniature parts

Benefits

- Long life: high load carrying capacity
- High positioning accuracy: fine resolution
- Exceptional reliability

Grooved rollers are the basis of SV/PV recirculating roller screws (fig. 20).

Typical applications

Ultimate positioning accuracy can be obtained using the fine lead of SV/BV/PV recirculating roller screws. Their great mechanical advantage minimised input torque and increases resolution. They can simplify a complete transmission and improve its rigidity. They are often used in applications of advancing technology where reliable optimum performance is vital.

Examples:

- Grinding machines
- Laboratory equipment
- Hospital equipment
- Paper-making
- Printing industry
- Telescopes
- Satellites

3 Driving systems

Roller screws

Complete assemblies (fig. 21)

Selected roller screws, both planetary and recirculating, are available within reduced delivery times, with customised screw shafts from premachined stocked units: see **pages 138-139** for planetary and **150-161** for recirculating roller screws.

Maximum speed

For screw assembly BRC + FLRBU or BVC + FLRBU, the maximum speed is defined by the product $n \times d_0$.

$n \times d_0$ < 160 000 for BRC
< 20 000 for BVC $\varnothing > 25$
< 30 000 for BVC $\varnothing \leq 25$

(n = rotational speed

d_0 = outside diameter of screw shaft)

Fig. 21

Service range

General rules

Delivery time	Delivery time from a couple of days to max. two weeks is possible for orders meeting the following conditions:
Quantity	<ul style="list-style-type: none">• Max. 3 pieces for planetary and recirculating roller screw.
Materials	Both shafts and nuts should be made of standard steel (refer to our catalogue 4351). Neither stainless steel nor special treatments are accepted through this quick channel.
Capabilities	<ul style="list-style-type: none">• Standard nuts (no special documents such as conformity report), with axial play, backlash elimination or preload.• Screw dimensions: see limitations on page 138-139.• Standard machining: no spline, no hollow shaft, no radius in grinding operations. If any such requirements, order cannot be accepted by the Service Channel. Unless specified, tolerances will be according to class 5, ISO 3408-3 (see catalogue 4351 - page 24). <p>FLRBU thrust bearing units can be delivered for all sizes.</p> <ul style="list-style-type: none">• Lead precision: G5 to ISO standard.• Lubrication: screw assemblies delivered with machined ends are greased with SKF LGEP2 (temperature range: -20 °C to +120 °C); without end machining, they are only protected with rust inhibitor.
IMPORTANT	Screws for nuclear, aerospace, military or medical applications are excluded.

Planetary roller screws with bearing units

Delivery time

- 1 week** Without end machining
2 weeks With machined ends

Nuts

With backlash elimination by oversize rollers: BRC

Capabilities

- Machined ends:
- premachined shafts for machining by the customer
 - to customer drawing (see general rules)
 - suitable for FLRBU units.

Screw dimensions: see [page 138-139](#)

Delivery time

- 4 weeks** With machined ends to customer drawing

Nuts

- With axial play: SRC-SRF
- With backlash elimination: TRU-TRK
- Preloaded: PRU-PRK for optimum rigidity

Capabilities

- Machined ends:
- to customer drawing (see general rules)
- Screw dimensions:
- up to 1 500 mm max. length
 - up to 900 mm threaded length.

Recirculating roller screws with bearing units

Delivery time

- 1 week** Without end machining
2 weeks With machined ends

Nuts

With backlash elimination by oversize rollers: BVC

Capabilities

- Machined ends:
- premachined shafts for machining by the customer
 - to customer drawing (see general rules)
 - suitable for FLRBU units.

Screw dimensions: see [page 150-151](#)

Delivery time

- 4 weeks** With machined ends to customer drawing

Nuts

- With axial play: SVC
- Preloaded: PVU-PVK for optimum rigidity

Capabilities

- Machined ends:
- to customer drawing (see general rules)
- Screw dimensions:
- up to 1 500 mm max. length
 - up to 900 mm threaded length.

FLRBU - Accessories for roller screws

Accessories for screw shaft, flanged thrust bearing units: FLRBU

In standard version, the "FLRBU" thrust bearing unit is assembled according to drawing pages 138, 139, 150 and 151. If you require a different assembly, please indicate it when ordering. Greased for life with SKF LGEP2.

Symbols

C_{req}	N	Required load rating		c	μm	Travel compensation - the difference between the specified travel and the nominal travel. Its value is always defined by the customer: if not specified it will be assumed to be zero. (The specified travel can also be defined by the specified lead multiplied by the number of revolutions)	
C_a	kN	The dynamic load rating (L10 life) is such that 90 % of a sufficiently large sample of identical screws can be expected to attain or exceed 1 million revolutions under this constant centrally acting pure axial load without fatigue (flaking).		d_o	mm	Nominal Outside Root Bore } diameter of screw shaft	
C_{oa}	kN	The static load rating is that axial constant centrally acting load which produces a total permanent deformation of one raceway and roller of 0,0001 of the diameter of the curved surface of the roller.		d_1	mm		
				d_2	mm		
				d_b	mm		
F	N	Axial load		e_p	μm	Tolerance of actual mean travel, l_m relative to specified travel l_s	
F_c	N	Compression load		f	-	Factors	
F_m	N	Constant mean axial load		g	m/s^2	Acceleration of gravity: 9,8	
F_{pr}	N	The preload force between a nut half (or nut) and the shaft		l	mm	Length	
F_q	N	The squeeze load applied to two nut halves (or nuts) by the housing or fixing bolts		l_o	mm	Nominal travel - the nominal lead multiplied by the number of revolutions	
H_v	-	Vickers hardness		l_1	mm	Threaded length	
I	kgm^2	Inertia		l_e	mm	Excess travel - at each end of the threaded length a distance l_e is subtracted to leave l_u the useful travel. The specified lead precision does not apply to the lengths l_e . $l_u = l_1 - 2 l_e$	
I_L	kgm^2	Inertia of load		l_m	mm	Actual mean travel. The curve is the result of measurements at 20 °C of the screw shaft. l_m is the line which fits the curve by the method of least squares	
I_M	kgm^2	Inertia of motor		l_s	mm	Specified travel	
I_{nn}	kgm^2	Inertia of nut when turning nut		l_{tp}	mm	Maximum total length	
I_{ns}	kgm^2	Inertia of rollers when turning shaft		l_u	mm	Useful travel - the length of thread which is subject to the specified lead precision	
I_s	kgmm^2/m	Inertia of screw shaft per metre		m	kg	Mass	
L	10^6 revs	Life		m_L	kg	Mass of the load	
L_{10}	10^6 revs	Basic life rating, millions of revolutions		m_n	kg	Mass of the nut	
L_{10h}	hours	Basic life rating, operating hours		m_s	kg/m	Mass of the screw shaft per metre	
M	μm	Maximum difference between mean travels of screws in a matched set		n	rpm	Rotational speed	
N	-	Number of thread starts on the screw shaft		n_{cr}	rpm	Critical speed	
N_r	-	Standard number of rollers		n_p	rpm	Maximum permissible speed	
N_{max}	-	Maximum number of rollers		s_{ap}	mm	Maximum axial play	
P	W	Power		t	μm	Manufacturing tolerance	
P_h	mm	Lead		v	μm	Travel variation - the band width or the distance between the two straight lines parallel to the actual mean travel which enclose the curve	
R	$\text{N}/\mu\text{m}$	Rigidity	} including deflection of: • the nut body • rollers/nut contact • rollers/screw shaft contact • length of screw shaft in contact with rollers	v_{300}	μm	The bandwidth over any 300 mm section of the useful travel. v_{300a} and v_{300p} are actual and permissible values	
R_n	$\text{N}/\mu\text{m}$	Nut rigidity			v_u	μm	The bandwidth over the useful travel. v_{ua} and v_{up} are actual and permissible values
R_{ng}	$\text{N}/\mu\text{m}$	Minimum guaranteed nut rigidity			δ	μm	Deflection
R_{nr}	$\text{N}/\mu\text{m}$	Reference nut rigidity			α	$^\circ$	Helix angle of the screw shaft thread
R_s	$\text{N}/\mu\text{m}$	Screw shaft rigidity		λ	$^\circ$	Friction angle } $\tan \lambda = \mu$	
R_t	$\text{N}/\mu\text{m}$	Total rigidity		μ	-	Coefficient of friction	
T	Nm	Torque		μ_{st}	-	Coefficient of friction when starting	
T_B	Nm	Brake torque		μ_F	-	Coefficient of friction for bearing	
T_{dt}	Nm	Total torque at constant speed		σ	MPa	Nominal axial stress	
T_f	Nm	Torque from friction in support bearings, motor, seals, etc		σ_p	MPa	Real axial stress	
T_{pe}	Nm	Torque for play elimination		σ_t	MPa	Total stress	
T_{pr}	Nm	Preload torque		τ	MPa	Nominal shear stress	
T_{st}	Nm	Starting torque		τ_p	MPa	Real shear stress	
T_t	Nm	Total torque		η	-	Theoretical direct efficiency	
U	mm	Stroke length	} life calculation	η'	-	Theoretical indirect efficiency	
V	h^{-1}	Strokes per hour			η_p	-	Real direct efficiency
W	h/day	Hours per day			η'_p	-	Real indirect efficiency
X	days/year	Days per year			θ	$^\circ$	Angle of twist
Y	years	Years		$\dot{\omega}$	rad/s^2	Angular acceleration	
Z_s	cc	Grease quantity for screw shaft		Ω	$\text{mm} \times \text{rpm}$	Speed quotient, $n_p \times d_o$	
Z_n	cc	Grease quantity for nut

Roller screws

Applications

In response to industry's ultimate need to produce more with less, SKF has

combined its knowledge and experience with the latest technology to develop solutions for your specific conditions. Whether your goal is to design equipment

that provides more customer value, or to increase overall profitability, with SKF experience and expertise, you're likely to find a real solution.

Plastic injection molding

a) Planetary roller screws

Notes

A large grid of graph paper for taking notes, consisting of 20 columns and 30 rows of small squares.

The right solution under all conditions

According to its own survival mode or defence demands, the chameleon can quickly change its own skin colour in order to reduce its visibility to any predator.

This ability of a species to adapt to the surrounding environment has served as an inspiration for SKF to create customised solutions which are totally in line with individual requirements.

Beyond the standard product range, SKF designs and manufactures the ideal solutions to render each application faster and more efficient.

Ask SKF. Your customised solution is close at hand.

Actuation systems

About Actuation Systems

Linear drive applications often require superior performance from the actuator in speed, temperature stability, accuracy and noise levels. SKF produces a large range of actuator products designed to satisfy the most demanding requirements. The assortment includes telescopic pillars (fig. 1), linear actuators (fig. 2) and control units (fig. 3), providing a total system solution for various applications. SKF leads in the industrial field where actuators are used in many different applications. SKF supplies a wide range of actuators but also offers extensive knowledge and experience in application engineering. This background has developed through long standing cooperation with leading companies in many industrial sectors.

Operating precision (table 1)

Comparison of the different positioning components and systems.

Operating precision (μm)	Guiding systems	Driving systems	Actuation systems	Positioning systems
0,1-1	Precision rail guides	Roller screws		
1-10	Standard slides			
10-100	Profile rail guides	Ball screws		
100-1 000	Linear ball bearings	Linear motors	Electro-mechanical actuators	Standard drives or linear motors with all guiding systems

Selection guide

Selecting actuators, made easy

Finding the right electric actuator for an application usually requires knowing many application details and making several calculations. However, there are ways to first narrow the selection to one or two safe choices. Using the selection guide on **pages 162-164**, you may easily find those actuators that meet your first criteria of load and speed as well as basic information about available controls and operating devices. This is normally the most important first step to carry out. On **pages 165-223**, you will find detailed information and type keys of the individual product(s). In case you need more explanation on technical terminology (glossary) and important considerations in selecting the right actuator for your applications, **pages 230-232** may be useful.

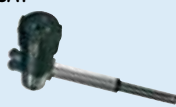

N.B.:

In addition to this catalogue, all product brochures are available on www.skf.com as PDF files.

Telescopic pillars

TELEMAG

The Telemag line of telescopic pillars features the best combination of minimum retracted length and large stroke length (fig. 4). They are used wherever robust and safe guiding systems are needed. The attractive design allows the Telemag to often become part of the overall design of the equipment.

Benefits

- High offset load
- Silent operation
- Robust
- Long life time

4 Actuation systems

Telescopic pillars

TELEMAG TFG

Telemag TFG (**fig. 5**) is a very compact, fast and powerful lifting pillar for loads of up to 2 500 N. The TFG can be used for push or pull applications. Thanks to the rigid aluminium profiles and the precision glide pads, the TFG can lift offset loads without distorting. The pillar consists of three designed aluminium profiles inside each other which are extended and retracted by means of an integrated linear actuator. TFG integrates a DC-motor with worm gear, whose rotary motion is converted into a linear motion by means of a spindle nut system.

The pillars run very quietly and with minimum vibration at a maximum speed of 19 mm/s. Maximum stroke length is 700 mm. The TFG is self-locking for both push and pull. The stroke is limited by integrated end limit switches. For additional safety, the TFG has cut-off switches at the end positions as well as a back up nut.

The TFG is compatible with all the other actuators from SKF and can be utilized in a full system of actuators and controls.

Benefits

- Push or pull force
- Compact design
- Fast movement
- Powerful

Options

- Encoder
- Cable feed-through

Accessories

- Control boxes
- Hand switches
- Foot switches

Standards

- EN/IEC 60601-1
- UL 60601-1

Dual encoder, cable with DIN8 plug

TELESMART

This cost effective telescopic pillar offers an attractive design for height adjustable desks, tables, chairs and lightweight industrial workstations (**fig. 6**).

The TXG series has an integrated control unit and combines the advantages of AC and DC power.

The pillars can be controlled by using desk, hand or foot switches.

Benefits

- Easy plug and play system
- Powerful and fast lifting
- Aesthetic design
- Cost effective
- Duty cycle 1 min./9 min.

Linear actuators

CAT

The CAT (**fig. 7**) modular design concept makes it easy to interchange critical components such as motors, gears, screws, attachments, etc. Custom built actuators are easily and cost efficiently built from standard parts. The CAT range flexibility makes it suitable for a high number of applications.

Benefits:

- Small
- Robust
- Highly efficient
- Lubricated for service life

CAR

The CAR (fig. 8) range of industrial type actuators offers a unique standard of performance, durability, and reliability. The compact design incorporates well-proven parts like the SKF high efficiency ball screw, a sturdy gearbox assembly, and high quality DC and AC-motors. These provide the best performance possible with an extended operational life. Individual application requirements can easily be matched thanks to the modular design concept.

Benefits:

- Robust and reliable
- Long life time
- Wide component range
- Left and right hand versions

MAGFORCE

The MAGFORCE (fig. 9) line consists of spindle lifting drives with worm gears. They fulfill the highest demands for industrial and other applications. The drives are available in several different motor versions.

MAGFORCE offers strong, fast and quiet movements with high duty cycle. The drives

include many interface options as hall encoder, end switch, extended shaft etc.

Benefits:

- Ideal for heavy load applications
- Wide speed/force range
- Robust design

4 Actuation systems

Linear actuators

CALA 36A

CALA 36A (fig. 10) is a compact 12/24 V DC actuator, intended for industrial use. The motor and drive spindle are connected in-line through a planetary gear assembly. This makes the compact design suitable in applications where space is restricted. A comprehensive range of suitable SKF control systems is available.

Benefits:

- 600 N load capacity
- 12 or 24 VDC
- Compact design
- Lubricated for service life
- Corrosion-resistant design
- High operating reliability
- Selection of front attachments
- Limit switches as accessories

Fig. 10

Linear actuators

MATRIX

The MATRIX (**fig. 11**) series includes powerful AC and DC actuators. They run very quietly, take up little space and can be installed at virtually every angle in vertical or horizontal position.

Benefits

- Long service life
- Silent operation
- Full system with control, operating units and accessories
- Synchronization possible
- Compact and aesthetic
- Back-up nut in standard
- Duty cycle 1 min./9 min.

4 Actuation systems

Linear actuators

CARE 33

Efficient design allows the CARE 33 (fig. 12) actuators a high dynamic load capacity, silent operation and low current consumption. The gearbox is allowed to float so that the load path passes directly through a support bearing located in the rear attachment. This design offers long operational life and minimizes the transmitted noise level. The CARE 33 actuator system offers a wide range of extra features such as power saving, overload protection, transformer cut-off, infrared remote control and CAXC limit switches.

Since the motor is capable of generating greater torque than required to produce the rated thrust, our selected control units are configured to ensure proper function.

Benefits

- Silent operation
- Multiple speed/load variants
- Easy to adjust limit switches
- Different attachment options

Linear actuators

ID8B series (fig. 15)

Features / Benefits

- Ambient temperature –26 °C to +65 °C
- High efficiency ball screw
- High efficiency ball screw drive
- Extension tube (stainless steel)
- Protection tube (steel), powder coated
- Powder coated aluminium alloy housing
- Powder metal gears
- Enhanced corrosion resistance
- Overload protection (clutch)
- Lubrication for service life
- Robust, designed for tough environment
- Static load capacity 13 600 N
- No back driving
- Duty cycle 25 %
- Certified (CE 55011)

Option

- Thermo protection
- Potentiometer (10 kΩ/10 turns)

Control units

Control units

A large number of control units (**fig. 18**) are available to operate the linear drives and telescopic pillars. They allow the connection of up to 5 actuators or several external options. There is also a version to operate battery powered DC actuators.

Benefits:

- Application focused system control
- Operation of up to 5 actuators
- Connections for foot, hand or desk switches
- Basic functions or encoder processing versions

Control units	Type	Control	Max. motor connections	Input	Output

The SCU solution offers many more possibilities than those given in the type keys. Please feel free to ask for more functions like "virtual limit switches", "external limit switches" and so on.

4 Actuation systems

Hand switches

Hand switches

The hand switches (**fig. 20**) serve for operating one or several actuators. With the pushbuttons field on the front panel, the movements of the actuators can be controlled easily and precisely. The hand switches are available with different plug options. There is also an infrared version for more flexibility in remote operating.

Benefits:

- Easy and precise
- Flexible and remote operation
- Ergonomic design
- Different plug options

Glossary and definitions

AC motors

An electric motor powered by alternating current electricity (120–400 V AC), which requires an electrician for its connection. Startup properties can be improved with various accessories and different methods of connection. There are many standard accessories available for control and regulation of an AC motor. An AC motor is best suited to non-mobile products, i.e., fixed installations, often in industrial environments. An actuator with an AC motor is less sensitive to load variations and maintains virtually the same speed regardless of load. The normal working temperature for this type of motor is 70 °C. An AC motor has few moving parts that wear and is consequently rugged and has a long life span.

Alignment

It is important that the product is mounted properly from the beginning. If the actuator is improperly installed, normal operation may cause poor performance. Remember, therefore, to carefully follow the accompanying mounting instructions. Naturally, you can turn to your supplier or distributor whenever you have questions about our products.

Anti-pinching (electric)

A safety device that is available on certain SKF actuators. It shuts off the motor when an external force is applied in the opposite direction to the direction of travel.

Anti-pinching (mechanical)

This safety device allows the actuator to push but not pull or pull but not push. This feature is designed to prevent injury to persons due to being trapped by the force of the actuator.

Back-up nut

A nut, usually metal, of greater antishear strength than the drive nut and which only makes contact with the threads of the spindle when the threads of the drive nut fail.

DC motors

An electric motor powered by direct current electricity (12–48 V DC) that can be run on batteries. These motors are suitable for use in situations where you want to be able to

move the product easily and do not want a cable in the way. The speed of a DC motor is directly proportional to the load, i.e., the motor moves slowly under maximum load and fastest when run with no load at all. In many applications the actuator works both pushing and pulling, which means that the load works to “assist” in one direction and “resist” in the other. Consequently, considerable speed variations can arise.

Dynamic load

Maximal dynamic load refers to the maximum total weight or mass the actuator can move. Often, the decisive factor for maximal load is the size of the motor and the gearing employed. When an actuator is subject to loads exceeding the maximum stated value, the device simply stops. Certain actuator types have an integral mechanical safety device similar to a slip-clutch, designed to protect the motor and gears from damage. Electrical limit switches are another alternative. These protect the actuator from damage caused by excessive electrical current. All such safety devices are part of an operating system and it is important to be aware of them when using SKF actuators with other operating equipments.

Duty factors

A technical term expressing how long a motor can handle non-stop operation before it becomes overheated or otherwise damaged. It should be noted that “Duty Factor”, whether expressed as a percentage or time, varies depending on the working load for the motor. The duty cycle tells how often an actuator will be in operation within an application and the amount of time between operations. Because of the power lost due to inefficiency dissipated as heat, the actuator component with the lowest allowable temperature – usually the motor – sets the duty cycle limit for the complete actuator. Although, there is some heat loss from friction in the gearbox and by ball screw and acme screw drive systems. An example of a duty cycle calculation: assume an actuator runs for 10 seconds cumulatively, up and down, and then does not run for another 40 seconds. The duty cycle is $10/(40+10)$, or 20 %.

Emergency lowering

The emergency lowering safety feature enables the actuator to be lowered in the event of a power failure or malfunction. This option is used in most medical and health care applications.

Encoder

A rotary or linear sensor device that, when connected to a control unit, can be used to determine the position of an electric linear actuator.

First failure safety

First failure safety is a control system utilising redundant microprocessors in which one processor monitors the functions of the other and shuts down the system if a malfunction in the microprocessor occurs.

Hall sensor

A sensor whose output changes based on changes in magnetic flux. Typically used for RPM, position, or current measurement.

IP protection

This standard describes a system for classifying the degrees of protection required by the enclosures of electrical equipment. Developed by the European Committee for Electro-technical Standardization (CENELEC), these standards are designed to numerically rate an electrical product based on the level of protection its enclosure provides.

Limit switches

A switch used to limit motion or travel in a particular direction. Mechanical devices that when activated open or close an electrical contact. When the contact is closed voltage will flow through the switch, when open no voltage will flow through the switch. Limit switches come in various physical sizes and configurations and can be mounted internally or externally.

Linear speed

Linear speed is the term used when we talk about the distance, in millimetres, the tube in an actuator moves linearly over a given period of time (mm/s.), moving a load from its starting point to a new position. The speed can vary in different ways, depending, for example, on the motor employed. Actuators with direct current (DC) motors

have a speed variation directly proportional to the load on the device. That is to say, the larger the load, the lower the speed and vice versa. Actuators with alternating current (AC) motors move at a constant speed, which is not affected by the load on the actuator. Other factors affecting speed include ambient temperature and how well or poorly the actuator is integrated within an application. An actuator integrated in such a way that it is subject to uneven loads wears abnormally, which results in increased friction forces and decreased speed.

Potentiometer

The potentiometer is a displacement transducer. It incorporates the sensor and transducer function into one. A typical potentiometer consists of a uniform coil of wire of an element of high resistance such as carbon, platinum or conductive plastic. This uniform coil makes up the resistive element of the potentiometer whose resistance is proportional to its length.

Power consumption

An expression of how much electricity the motor uses when working. For DC

motors the power consumption is directly proportional to the load, and for AC motors the power consumption is constant. With alternating current, power consumption is low, so that simple cabling and other inexpensive accessories suffice. Installation is easy and the components are readily available. With battery operation, it is often adequate to use a small, lightweight battery that does not require much space and is relatively inexpensive.

Properties of ball screws

The ball screws (**fig. 24**) incorporated in SKF actuators are manufactured entirely from steel and equipped with a row of bearings located in a closed system between the nut and screw. The design yields extremely low friction coefficients between the nut and the screw, because of the rolling contact between the balls, the nut and raceway (similar to ball bearings). Wear is significantly reduced compared with a sliding screw, which results in a life span 10 times longer for a ball screw under the same working conditions. The durability of the screw also means that it tolerates extreme loads as well as high duty cycles. Thanks to its low frictional resistance,

the ball screw can maintain a very low operating temperature. As a consequence, the ball screw is particularly well suited for situations where it is required to operate over long periods at high speeds. High efficiency is one of the main characteristics of ball screws. Thanks to this high efficiency, it is possible to use a motor half the size compared to a sliding screw design. This means that, as a user, you obtain a more economical solution. An actuator based on a ball screw has minimal play, and consequently its precision is significantly higher in applications where positioning and repetitive precision are important.

Properties of the sliding screw

Sliding screws (**fig. 25**) are manufactured from rolled steel and the nut is made of plastic. This is a relatively cost effective design with favourable properties: plastic and metal work well together without binding. Also, actuators incorporating sliding screws usually offer a price advantage over those built around other types of screws. The sliding screw works very quietly, which means that it is well suited for office environments, hospitals, etc. Another significant advantage is the high friction coefficient in the sliding screw. This design is particularly well suited for actuators used in applications where they should be self locking, i.e., will not begin "moving backwards" under the weight of the load. For instance, when using the actuator to drive vertically adjustable tables, a sliding screw design allows you to put heavy loads on the surface of the table without changing its vertical position. In short, this means that no additional locking mechanism or brake will be necessary to keep the actuator in position when it is not in operation (however, e.g., in extreme vibrating application types additional arrangements may be needed to prevent back driving).

Fig. 24

Fig. 25

Pull force

The maximum retracting force that an electric linear actuator can produce in Newton (N). Some SKF actuators do not produce equal push and pull forces and others do not permit pull force at all.

Push force

The maximum extending force that an electric linear actuator can produce in Newton (N). Some SKF actuators do not produce equal push and pull forces and others do not permit pull force at all.

4 Actuation systems

Glossary and definitions

Retracted length

“Retracted length” is an expression for the shortest distance between the two fixed points on an actuator when the actuator is in its innermost position. The dimensions given reflect a measurement from the centre of the mounting holes, which means that the actuator requires a few millimetres beyond the given “retracted length” in order to fit. Remember that very few actuators are symmetrical. Thus it is important to note other dimensions as well for optimum fit and integration of the actuator. An actuator should always be mounted, insofar as is possible, so that it works linearly over its entire working range.

Self-locking

This property of the actuator means that it will not continue to move under the weight of the load after it has been switched off. The self-locking ability depends on the total efficiency of the actuator. If an actuator is not self-locking the function can be obtained by using a brake. On DC motors, the motor has to be short circuited. Self-locking load cannot, under certain circumstances, be completely ensured on all actuator models due to the type of application being run (e.g., high vibration levels)!

Supply voltage

Supply voltage is a measure of the voltage supplying a system, regardless of whether it employs AC or DC motors.

Static load (value not available in this brochure)

Maximal static load refers to the weight or mass that an actuator can be subjected to when standing still without causing permanent damage or causing the actuator to start “going backwards”. Subjecting an actuator to loads in excess of stated values can risk permanent deformation to some parts of the actuator.

N.B. Remember that in many applications and installations, it is not the weight applied directly but rather the load caused by leverage or similar forces acting on the actuator that are the decisive factors. An actuator is strongest in its shortest position and weakest in its outermost, most extended position.

Stroke length

Describes the length in millimetres that an electric linear actuator will extend or retract. Most standard products are available in increments of 50 mm or 100 mm. Customer specific lengths are available, minimum order quantities apply.

Temperature

Ambient work site temperature can be highly significant when making a choice between different actuators. Extreme heat or cold can reduce the working capacity of the equipment. If the equipment is used in temperatures as low as about $-20\text{ }^{\circ}\text{C}$, for instance, the lubricant can harden and impair the efficiency of the motor. If the temperatures climb up towards $50\text{ }^{\circ}\text{C}$, for instance, the grease can melt so that it drains away from the screw system, resulting in reduced or eliminated lubricant effect, increasing the risk of overheating in the motor.

Thermal protection

Protects drives and control units from overheating. A device that signals when an electrical assembly becomes too hot. The signal usually causes the shut-off of the electrical device.

Applications

In response to industry's ultimate need to produce more with less, SKF has

combined its knowledge and experience with the latest technology to develop solutions for your specific conditions.

Whether your goal is to design equipment

that provides more customer value, or to increase overall profitability, with SKF experience and expertise, you're likely to find a real solution.

Building automation

The highest power lies beneath the smallest things

An ant can lift up to thirty times and transport up to fifty times its own weight.

It's the power of such small things that has inspired SKF to create solutions with reduced dimensions yet endowed with great potential for your applications.

Behind compactness and decreased weight lies high performance which will lead to greater precision and

efficiency, while reducing cycle times to a minimum.

Miniature profile rail guides, miniature linear ball bearings, miniature ball screws, miniature slides – small units that can be placed almost anywhere, but always of the highest quality which you might expect from SKF.

Positioning systems

General

Positioning systems are compact and economic complete solutions. The assortment ranges from compact slides without drives through to highly dynamic, multi-axis systems with linear motor drive. SKF offers the following positioning systems:

- Miniature slides (fig. 1),
- Standard slides (fig. 2),
- Dovetail slides (fig. 3),
- Compact cross tables (fig. 4),
- Precision slides without drive (fig. 5),
- Linear ball bearing slides (fig. 6),
- Profile rail slides (fig. 7).

LZM miniature slides

With the new LZM miniature slide SKF offers the ideal solution for linear motion applications for short strokes and compact boundary dimensions. The use of miniature slides has increased in medical applications, measurement technologies, pneumatics, micro mechanics and micro electronics assembly, semiconductor manufacturing and fibre optics. The different miniature

slide components meet the highest precision standards; LZM miniature slides feature high running accuracy and smooth motion. The LZM are manufactured with all stainless steel components. Optimised hardness enables long endurance life and high performance within compact boundary dimensions. The miniature slides have been designed to ensure high system stiffness and precision guidance. Running accuracies of 2 µm over a stroke of 100 mm are attainable depending on the particular application. Ease of installation is another advantage of the LZM miniature slides. Unlike cross roller systems using 4 rails and cages to be assembled on the production floor, the LZM slide provides a complete slide that can simply be bolted into place without the use of precision devices to set preload. Every application provides new challenges for the modern designer. SKF will modify existing designs to meet your specific technical requirements.

Advantages for LZM miniature slides:

- Compact design
- High carrying capacity

- Very good running accuracy
- Smooth running
- High stiffness
- Easy assembly

For dimensions, see table on page 240.

Operating precision (table 1)

Comparison of the different positioning components and systems.

Operating precision (µm)	Guiding systems	Driving systems	Actuation systems	Positioning systems
0,1-1	Precision rail guides	Roller screws		
1-10	Standard slides			
10-100	Profile rail guides	Ball screws		Standard drives or linear motors with all guiding systems
100-1 000	Linear ball bearings		Electro-mechanical actuators	

5 Positioning systems

General

Fig. 2

GCL standard slides

Slide top and base of steel. The slides are provided with standard patterns of mounting holes. The slide top carries tapped holes, the base plate counterbored holes for cylindrical screws to DIN 912. The slides are fitted with SKF precision rail guides with crossed roller units. Internal stops serve as stroke limit.

For dimensions, see table on [page 244](#).

GCLA standard slides

Slide top and base of black anodised aluminium. In other respects, the design corresponds to that of the GCL slides except that they are lower in height.

For dimensions, see table on [page 246](#).

RM standard slides

Especially small design. Slide top of steel, guidance via SKF precision rails with double-sided centre rail and crossed roller units. Internal stops serve as stroke limits.

For dimensions, see table on [page 248](#).

Fig. 3

SSM and SSK dovetail slides

Slide top and base of grey cast iron. The slides are provided with standard patterns of mounting holes. Top and base plate both carry tapped holes. The slides have a lead screw drive. The SSM design has a micrometer knurl with vernier ring, while the SSK design is fitted with a hand crank. Both designs are fitted with a lateral locking device.

For dimensions, see table on [page 250](#).

Fig. 4

TO and TS compact cross tables

Table top, centre and base of black anodised aluminium with central viewing hole. The slides are fitted with SKF precision rail guides incorporating crossed roller units. The TO design does not have a drive but is provided with one lateral locking device per axis. The TS design has a micrometer attachment that is springloaded in one direction. In addition, one lateral locking device is fitted per axis.

For dimensions, see table on [page 253](#).

Fig. 5

RSM and RSK precision slides

Slide top and base of grey cast iron. The slides are provided with standard patterns of mounting holes. The slide top carries tapped holes, the base plate counterbored holes for cylindrical screws to DIN 912. They are fitted with SKF precision rail guides incorporating crossed roller units. The slides have a lead screw drive. The RSM design has a micrometer knurl with a vernier ring, while the RSK design is fitted with a hand crank.

For dimensions, see table on [page 254](#).

Fig. 6

LZBB and LZAB linear ball bearing slides

The slides are fitted with SKF linear ball bearings of ISO series 3. They are driven via SKF rolled thread ball screws attached on both sides. The slides are protected by bellows. The LZBB design has a closed housing. Shafts are attached on both sides in shaft blocks which also incorporate the bolt holes for attaching the slide. The LZAB design has an open housing. Shafts are attached over the entire length by shaft supports to prevent shaft deflection with large strokes or high loads. The slide is attached via the bolt holes in the two shaft supports.

For principal dimensions, see table on **page 256**.

Complete systems

On special demand, SKF designs and manufactures complete systems, either from SKF standard components or special solutions, that are exactly tailored to the respective application.

The different specifications are given in **table 2**.

Fig. 7

LTB profile rail slides

SKF profile rail slides are state-of-the-art systems that offer high load-carrying capacity and accuracy.

They are available in five sizes: 110 – 170 – 235 – 320 – 400 with two drives: ball screws or linear motors, with three covers: without cover – with bellows – with steel cover.

For principal dimensions, see table on **page 259**.

No speed limit here

Can you believe that, if a human being could race at a speed proportional to that of a butterfly in full flight, he or she would reach 34 000 kilometres per hour?

It's only a hypothesis of course, but enough to inspire us to create tools able to surmount practically any limit including that of speed.

For example, the SKF linear motor slides, which are at their best where

conventional slides have reached their limit, combine unbelievable speed with high precision.

Similarly, rotating ball nuts, thanks to the fixed screw, are capable of overcoming the critical speeds usually associated with ball screws, and can reach a speed rating of 90 000 Nd.

With SKF, maximum speed is an everyday norm.

5 Positioning systems

Standard slides

GCLA

Standard slides with slide top and base made of black anodised aluminium, for manual positioning.

In other respects the design is similar to that of the GCL slides except for the slightly reduced height.

5 Positioning systems

Standard slides

RM

Standard slides fitted with either cross roller rail guides or V-guided ball cages, for manual positioning; the opposing V-rails are screwed to a steel base plate. Slide top and bottom carry a standard pattern of mounting holes

Dovetail slides

Dovetail slides

SSM / SSK

SSM - with micrometer ring with spring preloading, allowing easy turning. One division equals 0,02 mm.

SSK - as SSM, but instead of knurled screw equipped with crank handle.

Profile rail guide slides

LTB with screw drive

SKF profile rail slides are state-of-the-art systems that offer high load-carrying capacity and accuracy.

They are available in five sizes:

110 - 170 - 235 - 320 - 400

with three covers:

without cover - with bellows - with steel cover

With bellows

With steel cover

1) Maximum stroke between end stops, with bellows

2) Maximum stroke between end stops, with steel cover

3) Maximum static load per table in X and Y

4) Maximum static moments in X, Y and Z

5) Maximum static load per screw

Profile rail guide slides, preferred range

LTB

SKF profile rail guide slides LTB of the preferred range are a price-efficient alternative to the in-house production. The LTB preferred range shows 2 widths in 3 lengths each and can be delivered in 2 working weeks. The slides are equipped with preloaded profile rails and preloaded ball screw, with bellows covers, end switches and motor coupling.

Integration means efficiency

Bees represent what is probably the most eloquent example of a society within the natural world. They exhibit a primordial model of social caste with subdivision of role, as well as full control over defence, labour and even reproduction.

Small organisational wonders of this kind have provided inspiration to SKF in the creation of solutions which transcend single components,

resulting in complete units and systems incorporating a wide range of products, to meet the requirements of each individual customer.

With SKF, even the smallest things become great.

Applications

In response to industry's ultimate need to produce more with less, SKF has

combined its knowledge and experience with the latest technology to develop solutions for your specific conditions. Whether your goal is to design equipment

that provides more customer value, or to increase overall profitability, with SKF experience and expertise you're likely to find a real solution.

Inspection machine for electronics

Components application
a) Profile rail guides
b) Linear motors

Testing and 3D measurement machine

Components application
a) Precision rail guides
b) Linear motors

There's no power without performance

Most people think of the cheetah as the fastest animal because it can reach a speed of 100 kilometres per hour and can accelerate up to 70 in 2 seconds. Certainly this is amazing, but the cheetah doesn't possess the stamina of the gazelle which can race at 100 kilometres per hour for several minutes.

SKF has drawn inspiration from this meeting of power with performance.

Tools like the compact electro-mechanical cylinders combine the features of high acceleration, speed, compact dimensions, reliability and long duration.

With SKF, your applications will run properly for many years to come.

Customized solutions

Standard plug & play electromechanical cylinder

SKF cylinders using SKF planetary roller screws are expanding the limits of linear cylinders. They are designed for long life, high acceleration and high force applications. The cylinders use brushless servo-motor technology, with an in-line direct drive as standard. The high performance electromechanical cylinder consists of an SKF planetary roller screw directly driven through a coupling by a brushless motor. The roller screw converts rotary motion into linear movement.

Benefits

- The power of hydraulics
- The velocity of pneumatics

More information is available in **publication 5338**.

Compact electromechanical cylinder

Compact for all applications:

This product range provides high power density in a small package. Approximately 40 % smaller than standard electromechanical cylinders, there is the added advantage of reduced weight. Ideal for fixed and robot mounted applications. Whatever the requirement, CEMC cylinders provide a compact and dynamic solution, maximum performance and value through high availability, productivity and consequent low costs through the life of the product.

Benefits

- High power and reliability
- Compact and dynamic solution

More information is available in **publication 5338**.

Complete systems for positioning

On special demand, SKF designs and manufactures complete systems, either from SKF standard components or special solutions that are exactly tailored to the respective application.

Linear motor tables

The compact cross tables with linear motor drive are high-precision positioning units, equipped with ironless linear motor and precision cross roller rail guides with patented Anti cage creeping System (ACS). They are available in aluminium and cast iron and are ideally suited for wafer processing and measurements applications. The electrical stroke is set with optical limit switches, integrated in the length measurement system.

Notes

SKF – the knowledge engineering company

From the company that invented the self-aligning ball bearing more than 100 years ago, SKF has evolved into a knowledge engineering company that is able to draw on five technology platforms to create unique solutions for its customers. These platforms include bearings, bearing units and seals, of course, but extend to other areas including: lubricants and lubrication systems, critical for long bearing life in many applications; mechatronics that combine mechanical and electronics knowledge into systems for more effective linear motion and sensorized solutions; and a full range of services, from design and logistics support to conditioning monitoring and reliability systems.

Though the scope has broadened, SKF continues to maintain the world's leadership in the design, manufacture and marketing of rolling bearings, as well as complementary products such as radial seals. SKF also holds an increasingly important position in the market for linear motion products, high-precision aerospace bearings, machine tool spindles and plant maintenance services.

The SKF Group is globally certified to ISO 14001, the international standard for environmental management, as well as OHSAS 18001, the health and safety management standard. Individual divisions have been approved for quality certification in accordance with either ISO 9001 or ISO/TS 16949.

With some 100 manufacturing sites worldwide and sales companies in 70 countries, SKF is a truly international corporation. In addition, our distributors and dealers in some 15 000 locations around the world, an e-business marketplace and a global distribution system put SKF close to customers for the supply of both products and services. In essence, SKF solutions are available wherever and whenever customers need them. Overall, the SKF brand and the corporation are stronger than ever. As the knowledge engineering company, we stand ready to serve you with world-class product competencies, intellectual resources, and the vision to help you succeed.

Evolving by-wire technology

SKF has a unique expertise in fast-growing by-wire technology, from fly-by-wire, to drive-by-wire, to work-by-wire. SKF pioneered practical fly-by-wire technology and is a close working partner with all aerospace industry leaders. As an example, virtually all aircraft of the Airbus design use SKF by-wire systems for cockpit flight control.

SKF is also a leader in automotive by-wire technology, and has partnered with automotive engineers to develop two concept cars, which employ SKF mechatronics for steering and braking. Further by-wire development has led SKF to produce an all-electric forklift truck, which uses mechatronics rather than hydraulics for all controls.

Harnessing wind power

The growing industry of wind-generated electric power provides a source of clean, green electricity. SKF is working closely with global industry leaders to develop efficient and trouble-free turbines, providing a wide range of large, highly specialized bearings and condition monitoring systems to extend equipment life of wind farms located in even the most remote and inhospitable environments.

Working in extreme environments

In frigid winters, especially in northern countries, extreme sub-zero temperatures can cause bearings in railway axleboxes to seize due to lubrication starvation. SKF created a new family of synthetic lubricants formulated to retain their lubrication viscosity even at these extreme temperatures. SKF knowledge enables manufacturers and end user customers to overcome the performance issues resulting from extreme temperatures, whether hot or cold. For example, SKF products are at work in diverse environments such as baking ovens and instant freezing in food processing plants.

Developing a cleaner cleaner

The electric motor and its bearings are the heart of many household appliances. SKF works closely with appliance manufacturers to improve their products' performance, cut costs, reduce weight, and reduce energy consumption. A recent example of this cooperation is a new generation of vacuum cleaners with substantially more suction. SKF knowledge in the area of small bearing technology is also applied to manufacturers of power tools and office equipment.

Maintaining a 350 km/h R&D lab

In addition to SKF's renowned research and development facilities in Europe and the United States, Formula One car racing provides a unique environment for SKF to push the limits of bearing technology. For over 50 years, SKF products, engineering and knowledge have helped make Scuderia Ferrari a formidable force in F1 racing. (The average racing Ferrari utilizes more than 150 SKF components.) Lessons learned here are applied to the products we provide to automakers and the aftermarket worldwide.

Delivering Asset Efficiency Optimization

Through SKF Reliability Systems, SKF provides a comprehensive range of asset efficiency products and services, from condition monitoring hardware and software to maintenance strategies, engineering assistance and machine reliability programmes. To optimize efficiency and boost productivity, some industrial facilities opt for an Integrated Maintenance Solution, in which SKF delivers all services under one fixed-fee, performance-based contract.

Planning for sustainable growth

By their very nature, bearings make a positive contribution to the natural environment, enabling machinery to operate more efficiently, consume less power, and require less lubrication. By raising the performance bar for our own products, SKF is enabling a new generation of high-efficiency products and equipment. With an eye to the future and the world we will leave to our children, the SKF Group policy on environment, health and safety, as well as the manufacturing techniques, are planned and implemented to help protect and preserve the earth's limited natural resources. We remain committed to sustainable, environmentally responsible growth.
