FLEXIBLE COUPLINGS**

HABIX® HWN / HWT HABIX® PLUS HPN / HPK

HABIX®

TYPE HWN

The flexible Habix® coupling, type HWN, is a distortion-free jaw coupling with flexible elements for the torsionally flexible connection of shafts. The advantage of the all-round-machined Habix® couplings is the precision of the operating characteristic as well as the increased durability. Habix® couplings are distortion-free up to the breaking load of the cast iron transmission cam and insure a maximum of operational safety. The flexible element is available in white color with a hardness of 92 Shore A and in red color with a hardness of 98 Shore A. It is resistant against wear as well as against oil, ozone and ageing. The flexibility of the couplings absorbs efficiently shockloads, torsional vibrations and noises. The flexible element of the couplings has been designed to compensate radial, axial and angular movements between the coupling halves. By the fixed position of the flexible element its deformability in axial direction is free and no harmful axial forces may disturb the machine bearing even with changing torques. The flexible element of the Habix® coupling allows a permanent thermal load up to 80 °C. Even low temperatures up to -20 °C are allowed. The flexible Habix® coupling can easily be connected and does not require a high accuracy of the shaft alignment.

TYPE

- > Standard coupling HWN
- > Taper bush type HWT
- > Combined type standard/taper HWNT
- > Components can be combined as needed

TYPE HWT – WITH TAPER BUSH

The Habix® coupling type HWT joins the advantages of the flexible couplings with the advantages of the taper bush system: fast and easy installation for a torsionally flexible connection between shafts and compensation of shaft misalignments. The HWT types with the taper bush system have the advantage that there is a backlash-free and at the same time axial

fixing of the shaft even at bigger shaft tolerances. In addition the slide fit allows the axial alignment of the coupling. The exchange of the flexible element is possible by simply sliding the coupling halves in axial direction without removing the driving or driven machine. The field of application of the Habix® coupling is all the engineering industry wherever a safe connection between motor and driven machine is required.

ALLOWABLE MISALIGNMENTS

Radial misalignment

Axial misalignment

Angular misalignment

- Reduction of the allowable values of misalignment when the combination of misalignments occur or at other rotational speeds:
- $$\frac{\Delta W_r}{\Delta K_r} + \frac{\Delta W_a}{\Delta K_a} + \frac{\Delta W_w}{\Delta K_w} \leq X$$

$\Delta K_{r/a/w}$ = allowable radial, axial or angular misalignment of the shafts resp. of the coupling halves

$\Delta W_{r/a/w}$ = measured radial, axial or angular misalignment of the shafts resp. of the coupling halves.

HABIX®PLUS

Habix®plus consist of two coupling hubs with curved jaws, which are produced with high concentricity. The precision rating is made of an extremely wear-resistant and temperature-resistant plastic. Up to size 48 the clutch is constructed of high-strength aluminum, from size 65 it is constructed of steel.

The equalizing element of the Habix®plus HPN or HPK coupling is the star. It transmits torque without backlash or vibration. The high-precision star insert defines the characteristics of the entire drive system.

Backlash is eliminated by the press fit of the star into the hubs. The Habix®plus HPN or HPK couplings has been designed to compensate radial, axial and angular movements.

The flexible element of the Habix®plus coupling allows a permanent thermal load up to 100°C or 120°C. Even low temperatures up to -30°C are allowed.

- > As proposed in the table (page 12) for surface cooled three-phase motors with cage rotor acc. to DIN 42673, page 1 (data for motor 56, 63, 71, 80, 315 L, 355 L, 400 L, see catalogue Siemens).

This allocation is a preliminary selection for normal conditions of operation.

For conditions of operation under shock and changing loads the selection must be made according to the following.

SELECTION

- > The torque of the machine T_{AN} is determined by:

$$T_{AN} [\text{Nm}] = 9550 \times \frac{P_{\text{Motor}} [\text{kW}]}{n [\text{rpm}]}$$

- > This torque T_{AN} multiplied by a safety factor S depending on the application and the temperature factor S_T (see table page 14) gives the required nominal coupling torque T_{KN} .

$$\text{Result: } T_{KN} \geq S \times S_T \times T_{AN}$$

DESIGN EXAMPLE FOR IEC STANDARD MOTORS

Dates of the plant

Driving machine:	
three-phase motor	225 M
Power of the motor:	$P = 45 \text{ kW}$
Rotation at speed:	$n = 1485 \text{ rpm}$
Driven machine:	mixer
Ambient temperature:	$+50 \text{ °C}$

Layout of the coupling

$$T_{AN} [\text{Nm}] = 9550 \times \frac{45 \text{ kW}}{1485 \text{ rpm}} = 290 \text{ Nm}$$

$$T_{KN} = 1.25 \times 1.5 \times 290 \text{ Nm} = 544 \text{ Nm}$$

- > Selection:
Habix® size 65 flexible element 92° Shore A

$$T_{KN} = 625 \text{ Nm}$$

- > In case that bigger shock or changing loads occur we recommend a revision according to DIN 740.

An adequate calculation program is available.

For such a revision the following information is required:

1. Kind of the driving machine
2. Kind of the driven machine
3. Power of driving and driven machines
4. Rotational speed of operation
5. Shock loads
6. Exciting loads
7. Moments of inertia of load- and driving sides
8. Starts per hour
9. Ambient temperature
