RINGSPANN® Registered Trade Mark of RINGSPANN GmbH, Bad Homburg

Freewheel Clutches

Introduction

RINGSPANN GmbH has operated for over 60 years, specializing in industrial freewheel clutch technology. **RINGSPANN CORPORATION**, as an exclusive distributor and licensee, manufactures and assembles sprag and roller clutches for the North American market. Superior German engineering and American ingenuity bring you a winning combination of quality products and delivery above industry standards. Products contained within this catalog represent **RINGSPANN CORPORATION** standard freewheel clutches. **RINGSPANN** can readily design new or modify existing products to suit your application.

“RINGSPANN CORPORATION for all of your Freewheel Clutch needs.”

The RINGSPANN Service Advantage

- **RINGSPANN** Freewheel Clutches — your sole source in North America
- Outstanding service and delivery through improved inventory
- Detailed application support backed by over 60 years of experience
- Direct sales and service from the manufacturer

The RINGSPANN Design Advantage

- Maximum torque capacity in a minimum space
- Springs on every sprag to provide extra security against failures
- Patented sprag profiles offer maximum life for each application
- **RINGSPANN** will modify existing product to meet your requirements

Issue 3/09-subject to technical changes

Function and Applications

FREEWHEEL CLUTCHES are machine elements with the following characteristics:

DRIVES IN ONE DIRECTION

The sprags lock the inner race to the outer race to drive and transmit torque.

SLIPS IN THE OTHER DIRECTION

The sprags do not lock but slip and allow the inner or outer race to "freewheel". No torque is transmitted.

The Freewheeling Function allows for:

INDEXING
OVERRUNNING
BACKSTOPPING

Indexing

Function

RINGSPANN Freewheels, as indexing clutches, allow for a unidirectional, intermittent motion when a reciprocating motion is applied to a driving race.

Advantages

- Noiseless operation
- Fine setting of the feed path
- No backlash

Applications

Printing machines
Wire forming machines
Forging presses
High voltage current controls
Packaging machines
Paper converting
Agriculture machines
Wood processing

OVERRUNNING

Function

RINGSPANN Freewheels, as overrunning clutches, provide for the automatic separation between the driver and driven equipment when the direction of force is changed.

Advantages

- Completely automatic
- Smooth transmission of torque

Applications

Dual drives
Starter & creep drives
Planetary gears
Ventilators and fans
Rollout tables
Rolling mills
Continuous heating furnaces
Conveyors

Backstopping

Function

RINGSPANN Freewheels, as backstop clutches, provide for the prevention of rotation in the reverse direction for safety and functional reasons.

Advantages

- Long life
- Lower cost
- Completely automatic

Applications

Inclined Conveyors and Elevators
Pumps, blowers, and ventilators
Grain Elevators
Cranes and winches
Torque converters
Fans
Gear drives
Ski lifts

Model FRS

The RINGSPANN Model FRS Clutch is designed as a general purpose freewheel to satisfy standard duty applications. These units are specially designed for overrunning, backstopping and indexing applications. The FRS Series is available with RINGSPANN RIDUVIT® Sprags, having undergone a process of diffusing chromium into the surface of the sprag, providing an extra hardened surface for superior wear resistance. All FRS Clutches are oil lubricated unless otherwise specified.

Model FRZ With Centrifugal Lift Off Z

Centrifugal Lift Off Z is designed for applications that require a low driving speed and a high speed, overrunning outer race. The FRZ features sprags that are designed to lift off the inner race during high speed overrunning of the outer race.

Chart B

SIZE	Lubrication	MAX BORE		MAXIMUM TORQUE CAPACITIES		Maximum Speeds (RPM)

Lubrication:

1. Oil lubricated FRS and FRZ Freewheels are furnished with lipseals for positive protection, and with open bearings to provide for proper lubrication supply throughout the clutch.
2. Grease-packed lubrication is available in all FRS Clutches and should be used for general duty applications.

Model FRX With Centrifugal Lift Off X

Centrifugal Lift Off X is designed for applications that require a low driving speed and a high speed overrunning inner race. The centrifugal force causes the sprag to lift off the outer race during overrunning. The lift off feature allows the freewheel to operate without friction and greatly reduces wear.

Figure B shows a RINGSPANN Freewheel in the overrunning mode. The sprags and the support ring are rotating with the inner ring. The centrifugal force has turned the sprag in a counter-clockwise position and located it against the support ring. During operation, each sprag moves into

this position individually. Once in position, there is no wear because of the clearance between the sprag and the outer race(a). When the speed of the inner race has dropped sufficiently to reduce the centrifugal force to that of the spring, the sprag returns to its location on the outer ring. (Fig. A)

Lubrication:

1. FRX Clutches are provided with sealed-for-life bearings. These clutches are maintenance free. Regreasing could lead to clutch failure.

Series FRS, FRX, FRZ

Dimensional Data

RINGSPANN CORPORATION manufactures a complete line of freewheel clutches. All clutches are held to the strictest of tolerances and conform to US machining standards.

Series FRS, FRX, and FRZ are designed and manufactured to provide quality freewheels that can be inventoried and made readily available to suit the customer's requirements.

RINGSPANN "Know How" enables RINGSPANN CORPORATION to provide the market with a clutch to suit your application.

The FR Series Freewheels are completely enclosed units that contain ball bearings and seals. Each of these units can be adapted to mate with pulleys, gears, sprockets, and torque arms.

	113.0	177.80	168.30	165.10	381.00/380.95	298.45	4.94, 5.00, 5.44—1 1/4 X 5/16 5.75, 5.94, 6.00—1 1/2 X 3/4 6.75, 6.88, 7.00—1 3/4 X 7/16	

* Six holes are equally spaced 60° apart with two additional holes located 30° from the six equally spaced holes and 180° apart.

• Centerline of the application of force on the outer ring should lie between the two ball bearings; this is particularly important for indexing applications.

**Custom and metric bore available upon request.

FR Series Clutch Selection Procedure

When selecting an FR Series Clutch based on torque, the following steps should be followed to ensure a correct selection.

- Calculation of required torque to be transmitted through the clutch:

$$\text{Torque (lb. ft.)} = \text{HP} \times 5250 \times \text{SERVICE FACTOR} \div \text{RPM}$$

$$\text{Torque (Nm.)} = \text{kW} \times 9550 \times \text{SERVICE FACTOR} \div \text{RPM}$$
- Apply the appropriate service factor based on the characteristics of the application. See chart D (below) for recommendations.
- Establish required bore dimensions.
- Determine the RPM of the overrunning race and the driving RPM.
 - Same direction rotation: overrunning speed is equal to the difference in the speed between the inner and outer race.
 - Opposite direction in rotation: the sum of the speeds.
- Determine from the application the correct model of FR Freewheel.
 - FRS**
 - RINGSPANN FRS is recommended for general purpose applications, suitable for backstopping, overrunning, and indexing applications.
 - The drive and overrunning RPM should not exceed the maximum speed listed in Chart A, pg.2.
 - Consult factory for applications that require torque or RPM greater than those listed.
 - FRZ**
 - RINGSPANN FRZ Clutches are used in applications requiring high speed overrunning outer race and low driving speeds.
 - The drive RPM should not exceed the maximum speed listed in Chart B, pg.2.
 - Overrunning speed must be greater than or equal to the lift off speed.
 - Torque requirements should be within the allowable limits.
 - FRX**
 - For optimal results, the RINGSPANN FRX can be used for applications requiring low driving speeds and a high speed overrunning inner race, typically used as a backstop.
 - The drive RPM should not exceed the maximum speed listed in Chart C, pg.3.
 - Overrunning speed must be greater than or equal to the lift off speed.
 - Torque requirements should be within the allowable limits.
- Determine method of lubrication. Many RINGSPANN clutches are available as oil lubricated, grease filled, or non-lubricated. See pg. 6 for FR Series options and pg.7 for accessories.

Recommended Service Factors

Chart D

LOAD	TYPE OF EQUIPMENT	AC MOTOR	DC MOTOR	GAS ENGINE
<u>Constant Torque</u> Gradually applied loads	Centrifugal pumps, uniform-loaded conveyors, fan blowers, mixers and generators	1.25	1.25	1.75
<u>Moderate Torque</u> Light shock loads	Centrifugal pumps, cooling towers, boiler-feed pumps, machine tools, textile machinery, oscillating pumps	1.5	1.5	1.75
<u>Medium Loads</u> Medium shock loads	Rotary kilns, rotary and screw pumps, paper-converting machinery, punch presses, shears	1.5	1.75	Consult factory
<u>Heavy Torques</u> Heavy shock loads	Drilling rigs, rubber mixers, papermaking machinery, pulverizing mills, steel slitters	2.5	3	Consult factory

- Consult factory for diesel engines.

FR Series

Lubrication

Grease lubricated

The FRS Series Clutch is available grease packed; these FRSG units are supplied with lipseals and open ball bearings.

Oil lubricated

The FRS and FRZ Series Clutches are furnished with lipseals and open bearings to provide the best supply of lubrication to the clutch. Unless otherwise specified, oil lubrication will be supplied on all RINGSPANN CORPORATION FRS and FRZ Freewheels.

Maintenance Free

The FRX units utilize sealed- for-life bearings and require no lubrication. FRX Freewheels are no maintenance clutches.

Options

Corrosion resistant

RINGSPANN Series FRX is available in a corrosion resistant (CR) design. Our special CR design incorporates the use of a full contact labyrinth seal to keep contaminants out; additionally we black oxide exposed surfaces to ensure long life.

RIDUVIT®

RINGSPANN CORPORATION Series FRS Freewheels are available with RINGSPANN RIDUVIT. The RIDUVIT process diffuses chromium into the surface of the steel sprag. RIDUVIT Sprags provide maximum wear resistance for indexing, backstopping, and overrunning applications.

How to Order

After determination of the clutch series and size, order specification should indicate type of lubrication, options, nominal bore, and keyway.

Example #1

RINGSPANN CORPORATION Series FRX, size 700, complete with torque arm. Clutch bore 2 15/16" with a 5/8" X 5/16" keyway. Clutch to be maintenance free with sealed-for-life bearings.

Selection

**FRX-700-2.9375-.625"
X .312"**

Selection

FRX-700 Torque Arm

Example #2

RINGSPANN CORPORATION Series FRS, size 500, grease lubricated. Clutch bored to 1.000" with a 1/4" X 1/8" keyway. Sprags should be treated with the RINGSPANN RIDUVIT process for additional life.

Selection

**FRSG-500-RIDUVIT-
1.000"-1/4" X 1/8"**

Example #3

RINGSPANN CORPORATION Series FRS, size 500, oil lubricated. Clutch bored to 1.250" with a 1/4" X 1/8" keyway.

Selection

**FRS-500-1.250"-
1/4" X 1/8"**

FR Series-Accessories

TA Torque Arms

TA torque arms are made specifically for use with the Ringspann FR_ series freewheel clutches. The use of the TA torque arms facilitates the use of a standard freewheel clutch as a backstop.

Torque arms are available with any Ringspann FR_ series size 300 through 1000. TA torque arms come predrilled and ready for installation.

Installation:

The torque arm must not be rigidly anchored. The torque arm must be restricted by either a non-threaded pin or an angle iron bracket. The torque arm must be free to move axially to prevent damage to the bearings in the clutch.

When a pin is used, the diameter of the pin must be 1/32 of an inch smaller than the pin hole (F) in the torque arm.

End Covers

End covers are available to protect operating personnel from coming in contact with the rotating shaft for all FR Series clutches. Contact factory for availability.

Labyrinth Seals

Labyrinth seals are offered to keep contaminants out of the clutch in harsh environments. Contact factory for availability.

FRH Series Low-Speed Backstops

FRH Low-Speed Backstops are well suited for conveyor and other material handling applications. They are available with bores from 2.75 to 7.00 inches and torques from 10,000 to 45,000 lb.-ft.

These backstops are equipped with taconite seals and axial retention on the shaft. They easily adapt to suit many existing backstop applications.

Dimensions (Inches)

FRXG Series Clutches with #10, 20 and 60 Torque Arm Kits

Freewheel Clutches with #10, 20 and 60 Torque Arm Kits are available to easily adapt to many of the high-speed external backstops currently in use. They are dimensionally interchangeable and offer greater torque capacity. The sprags in the "X lift-off" series centrifugally disengage from the outer race while overrunning. This results in **No Contact** or **Wear** of the sprags or outer race during operation. Also, **No Maintenance** is required for these units because they come sealed with Laminar-style labyrinth seals and are lubricated for life from the factory.

Dimensions (Inches)

Series ZZ With ball bearing properties

Features

ZZ Internal Freewheels...are sprag freewheels with bearing support and ball bearing properties. The freewheels are supplied grease filled for normal operating conditions.

These freewheels are designed to be built into the customer's housing making a compact, space saving solution.

The ZZ Internal Freewheels...are used as:

- Backstops
- Overrunning Clutches
- Indexing Freewheels

The torque is transmitted through the inner and/or the outer ring by press fit or keyway connection. Bores up to 40mm are available with torques up to 240 Lb Ft.

The following series are available:

ZZ = inner & outer press fit

ZZ-P = inner keyway & outer press fit

ZZ-PP = inner & outer keyway

ZZ-2RS = inner & outer press fit with 2 rubber seals

ZZ-P2RS = inner keyway & outer press fit with 2 rubber seals

Series ZZ

Keyway according to DIN 6885, page 3. Keyway width tolerance: JS10. The torques listed are nominal torques and contain a safety factor of 2.

Series CA Clutch Coupling Packages

Clutch couplings are used in applications that require the coupling of two in-line shafts, such as between a reducer and a pinion stand. The clutch should always be mounted on the low temperature shaft in any application. The CA series clutch couplings allow for the removal of the clutch,

adapter and coupling without moving the connected equipment. The clutch bore, coupling bore and distance required between the shafts must be specified at time of order.

Package Model Number	Clutch Model	Coupling Model	Max. Coupling Bore (Inches)	Max. Clutch Bore (Inches)	A Major Diameter (Inches)	C Bore Length (Inches)	E Overall Length (Inches)	DBSE (Inches)

Additional Style Clutch Coupling Packages

Other types of clutch coupling packages are available, such as close coupled, with disc couplings or with u-joint couplings. Consult factory for availability.

Series RC Backstops

Series RC Clutches are shaft mounted with the same diameter as a 200 series ball bearing, but have no bearing characteristics.

All 200 Series Clutches require bearing support, a shaft hardened to HRC 58-62 with a .060" case depth after grinding to a 16 micro finish. In addition, eccentricity between the shaft and the housing bore should not exceed .002" T.I.R. with a taper on the shaft not to exceed .0002" per inch of shaft. The RC200 Series requires lubrication and may be either oil or grease lubricated. Lubrication containing molybdenum disulphide must not be used.

Series RCD Backstops

Series RCD Backstops are a direct replacement for the Dodge backstops in TXT (and prior) series shaft mounted reducers. (see interchange chart at right.)

The RCD Backstops are equal dimensionally to the Dodge models and have equal or greater torque capabilities.

Automatic engaging and disengaging of drives.

Catalogue 80

Housing Freewheels

Automatic engaging and disengaging for multi-motor drives for installations with continuous operation.

Catalogue 80.1

Freewheel Elements

Cage Freewheels, Sprag Sets and Freewheel Chains.

Catalogue 89

Brakes

Industrial Disc Brakes

Spring Activated—Pneumatic Release.

Catalogue 46

Industrial Disc Brakes

Spring Activated—Hydraulic Release.

Catalogue 46

Industrial Disc Brakes

Spring Activated—Pneumatically Activated.

Catalogue 46

Industrial Disc Brakes

Brake Calipers—Hydraulically Activated.

Catalogue 46

Fall-Safe Clamping Units

For secure and precise positioning of piston rods.

Catalogue 32

Torque and Force Limiters

Torque Limiter with Screw Face

Reliable overload protection for tough operating conditions.

Catalogue 45

Torque Limiter with Rollers

With double or single Roller. Through ratcheting or disengaging, also for 360° synchronous running.

Catalogue 45

Torque Limiter with Spherical Rollers

Reliable overload protection with maximum response accuracy. Also backlash free.

Catalogue 45

Torque Limiter with Friction Lining

RIMOSTAT Torque Limiter for constant torque. Belleville Spring Torque Limiter for simple release.

Catalogue 45

Force Limiter

Reliable axial overload protection in piston rods.

Catalogue 49

Couplings

Flexible Couplings

Large, safe radial and angular misalignments. Minimum resiliency.

Catalogue 44

Clamping Coupling

For the automatic coupling of rolls. Fast, safe and free from slipping connection.

Cables

Push/Pull Cables for controlling force and motion. With or without control heads

Shaft Hub Connection

Cone Clamping Elements

For shaft-hub connections. High torques with small dimensions.

Catalogue 31

Three-part Shrink Discs

External clamping connection for the fastening of hollow shafts on solid shafts.

Catalogue 31

Two-part Shrink Discs

External clamping connection. Advantages: Simple, secure mounting even without torque wrench.

Catalogue 31.1

Star Discs

Ideal for shaft-hub-connection for frequent release.

Catalogue 30

Star Spring Washers

Axial spring elements for preloading of ball bearings.

Catalogue 20

Issued 03/2009
