

TRASCO® ES: "0" BACKLASH COUPLINGS

DRIVE
SOLUTIONS

TRASCO® ES

TRASCO® ES: “0” backlash couplings

TRASCO® ES is our zero backlash coupling designed to compensate for misalignment and vibration dampening for indexing applications. The compact design of TRASCO® ES makes it the right choice for all precise motion applications.

Description

The TRASCO® ES consists of two hubs, which are either made of high-strength aluminum (up to the 38/45 size) or steel (from size 42) that are connected with an elastic element.

The precise dimensional characteristics of TRASCO® ES are obtained through our accurate machining process.

The special compound polyurethane elastic element, developed through extensive research and laboratory testing, is made through a press-forming process which guarantees high dimensional accuracy.

The element is available in 4 different hardnesses: **80 Sh. A (blue), 92 Sh. A (yellow), 98 Sh. A (red), 64 Sh. D (green).**

Coupling performance depends on the type of element selected (see “**Technical characteristics**”).

Other element hardnesses are available upon request to meet special operating conditions, such as high temperatures and/or high torques, and for providing a high degree of vibration dampening capability. Please contact our Engineering Office for help in selecting the appropriate element hardness.

Note: It is possible to have aligned keyways upon inquiry.

Operation

When the polyurethane element is installed in its special seats between the hubs, it becomes precompressed, thereby providing the zero backlash feature which characterizes the transmission performance of this coupling.

With zero backlash, the coupling remains torsionally rigid within the range of the precompression load, but does permit the absorption of radial, angular, and axial misalignments as well as undesired vibrations.

The significantly wide precompressed area of the flexible element keeps the contact pressure against the elastic element low. Therefore, the element teeth can be overloaded many times without undergoing any wear or taking a permanent set.

Advantages

The TRASCO® ES coupling provides the following advantages:

- “zero-backlash” motion transmission
- dampening (up to 80%) of vibrations from motor shaft
- low heat and electrical conductivity
- easy and fast installation
- perfect balance (A & AP type)
- low moment of inertia (due to compact design and types of materials used).

Main applications

TRASCO® ES couplings are most frequently used with:

- servomotors
- robotics
- sliding tables
- spindle controls for drilling and grinding mandrels
- ball-bearing screws

Operating Temperature Range

The operating temperature range for the TRASCO® ES depends on the type of element. For the **92° Sh. A (yellow)**, the range is **between -40 and +90 °C**, and for the **98° Sh.A (red)**, the range is **between -30 and +90 °C**. Peak temperatures as high as 120 °C can be tolerated for brief instances. High operating temperatures can cause the elastic element to lose a considerable amount of elasticity, thus substantially lowering the torque handling capacity.

Therefore, when selecting a coupling, the operating temperature must be carefully considered (see “**Technical characteristics**”).

ATEX Directive 2014/34/EU

It is possible to ask for specific certification for use in hazardous area according to EC standard **94/9/EC**. TRASCO® ES couplings are available with specific mounting/operating instruction manual and conformity. For information, please contact our technical office.

Technical characteristics

The following technical characteristics apply to all types of TRASCO® ES couplings. When using the M, A and AP versions, check the torque values given in the table against the allowable hub transmission values for the respective versions given in the pertinent sections. TRASCO® ES couplings can withstand axial, radial, and angular misalignment. Even after operating for an extended period with a misalignment, there is still zero backlash because the elastic element is only stressed by pressure loads. When an application causes a high degree of misalignment, a double flexing type coupling can be provided which avoids the formation of reaction forces. Please contact our Engineering Office.

All the technical data in the catalogue are valid for rotation speeds of 1500 rpm and a working temperature of 30 °C. For linear speed over 30 m/s, dynamic balancing is recommended.

Misalignments

| | | |
|-------------------|------------------------------|--------|
| T _{KN} | Coupling nominal torque | Nm |
| T _{Kmax} | Coupling maximum torque | Nm |
| C _T | Torsional rigidity | Nm/rad |
| C _r | Radial stiffness | N/mm |
| ΔKa | Maximum axial misalignment | mm |
| ΔKr | Maximum radial misalignment | mm |
| ΔKw | Maximum angular misalignment | ° |

Selection in according to DIN 740.2

The coupling must be chosen so the applied working loads do not exceed the allowable values whatever the working conditions are.

1. Check the load with respect to the nominal torque

The nominal coupling torque must be greater than or equal to the nominal torque of the drive machine for all working temperatures.

$$T_{KN} \geq T_N \cdot S_\theta \cdot S_D$$

2. Check the load with respect to the torque peak values

The maximum coupling torque must be greater than or equal to the torque peaks that occur during operation for all working temperatures.

$$T_{KN} \geq T_S \cdot S_\theta \cdot S_D + T_N \cdot S_\theta$$

Motor-side peaks: $T_S = T_{AS} \cdot \frac{1}{m+1} \cdot S_Z$

Driven-side peaks: $T_S = T_{LS} \cdot \frac{m}{m+1} \cdot S_Z$

Or, in case of sporadic peaks: $T_{Kmax} \geq T_S \cdot S_\theta \cdot S_D + T_N \cdot S_\theta$

If the peak does not cover the nominal T_N , contribution, the $T_N S_\theta$ factor can be disregarded.

Calculation coefficients

S_θ = Temperature factor

| T (°C) | -30 °C / +30 °C | +40 °C | +60 °C | +80 °C |
|------------|-----------------|--------|--------|--------|
| S_θ | 1 | 1,2 | 1,4 | 1,8 |

S_D = Torsional rigidity factor

| Tooling machines | Positioning system | Speed and angular acceleration indicator |
|------------------|--------------------|--|
| 2-5 | 3-8 | 10 ≥ |

Starting frequency factor

| S/h | < 20 | < 60 | < 120 | < 180 | < 240 | > 240 |
|-------|------|------|-------|-------|-------|-------|
| S_Z | 1 | 1,2 | 1,4 | 1,6 | 1,8 | 2 |

$m = \text{Mass factor} = \frac{J_A}{J_L}$

Example of selection

Application

Servomotor driving a recirculating ball screw on a machine tool

| | | | | | |
|-------------------|----------|------------------------------|-------------------------|-------|------------------------------|
| Nominal torque | T_N | = 10,0 Nm | Shock type | S_D | = 3 |
| Peak torque | T_{AS} | = 22,0 Nm | Table moment of inertia | J_3 | = 0,0038 kg · m ² |
| Rpm | n | = 3.000 1/min | Driven shaft | dc | = 20 mm h6 (without keyway) |
| Moment of inertia | J_1 | = 0,0058 kg · m ² | Motor shaft | dm | = 24 mm h6 (without keyway) |
| Temperature | T | = +40 °C | | | |

Selection

24/28 "A" type TRASCO® ES coupling with "Red" elastic element (98 Sh. A)

| | | |
|---|------------|---|
| Standard coupling torque: | T_{KN} | = 60 [Nm] |
| Maximum torque: | T_{Kmax} | = 120 [Nm] |
| Hub Moment of Inertia: | J_2 | = 0,000135 [kg · m ²] |
| Couple Transmitted by taper locking ring: | T_{cal} | = $\begin{cases} 92 \text{ [Nm] bore 20 [mm]} \\ 113 \text{ [Nm] bore 24 [mm]} \end{cases}$ |

Load check

$$T_N \cdot S_\theta \cdot S_D = 10 \cdot 1,2 \cdot 3 = 36,0 \text{ [Nm]}$$

$$T_{KN} > 36,0 \text{ Nm} < T_{cal}$$

$$m = \frac{J_A}{J_L} \quad J_A = J_1 + J_2 \quad J_L = J_3 + J_2 \quad m = 1,5$$

$$T_S = T_{AS} \cdot \frac{1}{m+1} \cdot S_z = 22,0 \cdot \frac{1}{1,5+1} \cdot 1,5 = 13,2 \text{ [Nm]}$$

$$T_S \cdot S_D \cdot S_\theta = 13,2 \cdot 3 \cdot 1,2 = 47,52 \text{ [Nm]}$$

$$T_{KN} > 47,52 \text{ Nm} < T_{cal}$$

| | | |
|------------|-------------------------------------|------------------|
| T_{KN} | Coupling nominal torque | Nm |
| T_K | Motor-side nominal torque | Nm |
| T_{Kmax} | Coupling maximum torque | Nm |
| T_S | Motor peak torque | Nm |
| T_{AS} | Driver-side peak torque | Nm |
| m | Mass factor | Nm |
| J_A | Motor-side inertia | kgm ² |
| J_L | Driven-side inertia | kgm ² |
| S_z | Start frequency factor | |
| S_θ | Temperature factor | |
| S_D | Temperature factor | |
| T_{Cal} | Hub-shaft connection maximum torque | Nm |

torque depends on bore diameter.

SHRINK DISC EXECUTION

GESA execution

Execution with locking ring. This
execution is suitable for high speed
and high torque. Screws mounting
from spider side. Transmissible
torque depends on bore diameter.

GESAP execution

Execution with locking ring with high
machining accuracy: design suitable
for application on spindles according
to DIN 69002.

TRASCO® ES zero backlash copulings - GESP e GESF execution solid or bore hub

SIT coupling hubs are available from stock with either solid hub or with finished bores of standard shaft diameters. The setscrews of our finished bore execution are positioned 120 degrees from each other with one positioned 180 degrees from the keyway. Both the solid hub and bored hub coupling are generally available from stock for quick delivery. **Approved according to ATEX Directive.**
Note: It is possible to have aligned keyways upon inquiry.

Zero backlash - TRASCO® ES

TRASCO® ES zero backlash copulings - GESM execution with clamp hubs

It allows quick and secure fastening with no shaft-hub play. It is important to observe the tightening torque (M_s) of the screw shown in the table when using the keyless version, and check the torque transmissible by the clamp as a function of the shaft diameter (as well as the coupling size) shown in the table on the next page. Hubs with or without keyway and compact version with reduced overall length are available as standard. **Compliant with ATEX Directive. Note:** It is possible to have phase slots on request.

TRASCO® ES zero backlash copulings - GESS execution double cardanic execution

This execution allows higher misalignments. The 2 spiders allow a high vibration dampening providing a decrease in drive noise and longer life of related components (ex. bearings). The intermediate element is made of aluminum alloy and may be used in combination with any type of hub execution. **Note:** It is possible to have aligned keyways upon inquiry.

Zero backlash - TRASCO® ES

TRASCO® ES zero backlash copulings - GES LR3 execution with intermediate shaft

Ideal execution for long distance shaft connections. Torque transmission is zero backlash. It is used in applications such as automatic machines, lifting machines, palletizing machines, and handling machines. Designed for length up to 4 m without bearing support (depending on rotation speed). The double slot execution, allows spider mounting and replacement without driver/driven machine displacement. All aluminum alloy for a very low inertia. **Note:** It is possible to have aligned keyways upon inquiry.

Technical data for intermediate shaft couplings

| Size | Misalignment | |
|-------|-------------------------------|--------------------------------|
| | Axial ΔK_a [mm] | Angular ΔK_w [°] |
| 14 | 1,0 | 0,9 |
| 19/24 | 1,2 | 0,9 |
| 24/28 | 1,4 | 0,9 |
| 28/38 | 1,5 | 0,9 |
| 38/45 | 1,8 | 0,9 |

Angular misalignment = 0,9° for spider

Radial misalignment

$$\Delta K_r = (L_z - 2 \cdot H - M) \cdot \tan(\Delta K_w) \quad [\text{mm}]$$

$$C_{\text{Tot}} = \frac{1}{2 \cdot \frac{1}{C_{\text{Tanello}}} + \frac{L_{\text{allunga}}}{C_{\text{Tallunga}}}} \quad [\text{Nm/rad}]$$

$$L_{\text{allunga}} = \frac{L_{\text{zw}} - 2 \cdot L}{1000} \quad [\text{mm}] \quad \text{with } L_{\text{zw}} = \text{total coupling length}$$

Selection diagram GES LR3 coupling

TRASCO® ES zero backlash copulings - GESAP execution shrink disc execution according to DIN 69002

Precision “zero-backlash” coupling designed for multi spindle devices on machine tools or controls with reduced mass, such as short center spindles, multi-centers primary spindles in work stations, or joined to high speed bearings with limited tolerance range. It is suitable for very high speeds of rotation (up to speeds of 50 m/s). **Note:** It is possible to have aligned keyways upon inquiry.

Zero backlash - TRASCO® ES

Installation and maintenance

1. Carefully clean the shafts
2. Insert the hubs onto shafts being connected. With the M, A and AP versions, be sure to tighten the screws with the Ms torque value given in the catalogue. Be careful with the A and AP versions to tighten the screws uniformly and crosswise to the recommended torque
3. Position the element in one of the two coupling hubs
4. Fit together the two coupling halves, making sure the “s” dimension is properly observed. This must be done to insure proper elastic element function and long service life, as well as to assure the coupling is properly insulated electrically

With the A and AP versions, mounting the hubs can be facilitated by lubricating the shaft contact surfaces with an oil, but do not use a molybdenum bisulphide based oils. When mounting the TRASCO® ES coupling an axial thrust is generated which disappears when the mounting has been completed to avoid putting axial loads on the bearings. Lubrication of the elastic element will reduce the amount of axial force required during installation.

Note: All rotating parts must be guarded.
